HEAD OFFICE

TORONTO, ONT.

GENERAL INFORMATION

In compiling this publication, Canadian General Electric Company Limited has endeavoured to make it a complete and up-to-date reference book of standard lighting equipment, illustrating and describing material for which there is a constant demand. Special catalogues, bulletins and prices covering material not fully described nor shown in this book will be furnished on request.

PRICES

The prices shown in this book agree with the latest correct list prices at time of issue, but are approximate only. They are not offered as a quotation, and are subject to change without notice.

ORDERING

Always specify catalogue number and give a description of the equipment required. Address the Canadian General Electric office nearest you. Orders should be kept separate from all other correspondence to assure prompt attention to both.

SHIPMENTS

Routing or shipping instructions should be specified on each order. If specific instructions are not given we shall use our best judgment in selecting the route, but we accept no responsibility for extra cartage or handling expense at destination.

We do not hold ourselves responsible for any loss, damage or pilferage sustained in transit, and claims of such character should be promptly entered by the purchaser against transportation companies.

RETURNING GOODS

Goods must not be returned for credit or exchange without first consulting us for shipping instructions.

LISTING

Dimensions are given for reference only, and before such figures are used in plans, specifications or constructions, samples of the material should be obtained, and figures confirmed by correspondence. Canadian General Electric Company Limited reserves the right to change dimensions and specifications of material listed in this book without notice.

Packed shipping weights are given throughout this book. These are average weights only and may vary slightly. Consequently, we do not guarantee absolute accuracy but offer them as close approximations.

All equipment listed in this book is approved by Canadian Standards Association.

Room Index is the classification of a room according to its proportions; large and small rooms of the same proportion have the same Index. Hence, for

large rooms of dimensions greater than those shown, divide each dimension by the same number and use the Index determined for the smaller room.

50	6	6	7	8	9	10	10	11	12	13	15	16	18	19	21	
60	5	5	6	7	7	8	9	9	10	11	12	13	15	16	17	

*Figures are based on 40 watt 60 cycle 4500°K white lamps rated at 2100 lumens. For 60 cycle 3500°K white lamps multiply values by 1.09. For 60 cycle 6500°K Daylight lamps multiply values by 0.91.

For 85 watt lamps multiply foot-candle values by 1.90 for 4500°K white lamps; by 2.0 for 3500°K white lamps; and by 1.86 for 6500°K Daylight lamps.

For 25 cycle lamps multiply 60 cycle foot-candle values by 0.95.

	1500	8	9	10	11	12	13	14	16	17	19	21	23	25	28	31	34	37	40

While the above table is designed for finding computed values of illumination using a maintenance factor of 0.70, values of illumination resulting from using other maintenance factors can be calculated by multiplying the footcandle figure taken from the table by the ratio of the maintenance factor to 0.70.

Example: If maintenance factor is 0.65, multiply footcandle figure taken from the table by $\frac{0.65}{0.70}$ to arrive at the proper value of illumination.

*For 400 W. H-I Mercury Lamp, values will be about 6% higher than shown for the 750 W. lamp.

RLM Types

- 2-lamp, open or closed end 80% (1)
 2-lamp, louvered 65% (6)
 2-lamp, dust tight 65% (5)
 2-lamp, horizontal louver 65% (5)
 3-lamp, open or closed end 70% (3)

Mercury (H9) Type

- Shallow white 80% (1)
 Aluminum (45° Shielding) 65% (6)

Low-bay filament units

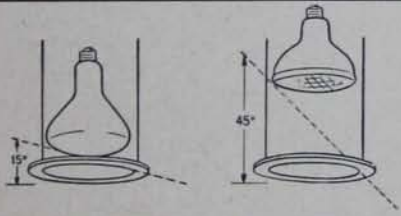

- RLM with I.F. Lamp 80% (1)
 RLM with white bowl lamp 65% (5)
 Dust tight 65% (5)
 Silver bowl diffuse reflector 65% (6)

High and Medium bay units

- Mirrored or Prismatic Glass, or Aluminum, 80% (2)
 Mercury type 70% (4)
 Glass covered 70% (4)
 Deep bowl porcelain enamelled reflector (3)

GENERAL ELECTRIC "STATESMAN"

Ceiling Type Statesman

The Statesman† is a superb new luminaire that is beyond all comparison for lighting effectiveness and architectural beauty. Gracefully proportioned and modern in design, this luminaire is suitable for general and private offices, stores, schools, drafting rooms, banks, libraries . . . and other commercial applications where efficient lighting of the semi-direct type is desired.

The Statesman is equipped with a new curved-type Holophane Controlens which collects the light from the lamps and bends it downward in an intensive pattern, producing maximum illumination over the useful areas. This bending action eliminates all glare at normal viewing angles. Even in large rooms, this shielding feature prevents any possibility of cumulative glare which ordinarily results

from the use of many light sources. The upper refracting lenses spread an appreciable amount of illumination across the ceiling to furnish a luminous background for the lighting system. This helps to soften shadows and reduces brightness contrasts within the field of view.

The Statesman is designed to take two, three or four 40 watt fluorescent lamps. It is available in two models: the Ceiling Type and the Suspension Type. Each model may be installed in continuous runs if desired.

Luminaires for 25 cycle operation may be obtained with opaque metal top panels in place of the upper refracting lenses. See catalogue specifications below.

ROD HANGER ONLY											
9199	3.30	24†	3

NOTE: When ordering Suspension Type, specify as two items, namely: Ceiling Type and Rod Hanger.

*3 phase.

†Hanger length only, ceiling to top of fixture. Overall suspension to bottom of fixture, 32 inches.

For additional length hanger, add \$1.00 per foot, or fraction.

Fixtures for 66 2/3 cycle operation available at same price as 60 cycle fixtures, Cat. 9110-C, etc.

Lamps are not included in prices. ‡Manufactured under Holophane license.

GENERAL ELECTRIC "STATESMAN"

Suspension Type Statesman

Construction

Heavy gauge metal, finished in baked white enamel, is used throughout. All auxiliary equipment is mounted in the housing for ease of installation and maintenance. One piece reflector is easily detached from housing by two wing nuts, without disturbing wiring. The housing is ventilated to ensure proper cooling of the ballasts. Lamps can quickly be replaced by slipping out the four lenses. All glass parts are carefully fitted so as to exclude the collection of dust from the inside of the unit. Stamped canopy and stems are finished in satin alumilite.

Auxiliary Equipment

Luminaire is supplied wired, complete with FS-40 Watch Dog starters and approved high power factor ballasts which reduce stroboscopic effects to a minimum.

Description of Controlens

The lower refracting glass member consists of four Holophane Controlens butted together so as to function as one continuous lens. Properly aligned with the lamps, this Controlens directs 70% of the light which it intercepts into the useful 0-60 degree zone. The result is a highly efficient production of illumination and a notable absence of glare.

The upper glass member has a double function; i.e., that of a reflector to augment the light directed from the lamps to the Controlens and, thus, add to the downward component of the unit; and that of a refractor which, permitting certain light rays to pass through, spreads them widely across the ceiling so as to furnish a luminous background to the unit.

Continuous Mounting of Ceiling Type

GENERAL ELECTRIC "STATESMAN"

Cross Section of No. 9112

Distribution

Distribution of these units is intensive, with 70% of the total output directed into the useful 0-60 degree zone and 19% upward toward the ceiling.

Spacing

Because of today's demands for high illumination levels, fluorescent units are usually closely spaced or ganged together in continuous runs. Maximum permissible spacing is, therefore, of little interest except where uniform illumination of a low level is required. In that case, the units may be spaced as far apart as 1.25 times their mounting height above the work.

Brightness

The brightness of these units in the glare zone is very low. Typical values in candle power per square inch are:

Angle from vertical	60°	70°	80°
No. 9110	1.1	0.6	0.6
No. 9111	1.2	0.8	0.7
No. 9112	2.1	1.1	1.0

Plan Showing Mounting Channel

Installation

A removable steel channel, 3 inches wide and 32 inches long, acts as the backbone of the luminaire and is used for direct attachment to the ceiling or supporting stems. Luminaire secures to channel by means of four weld bolts and wing nuts.

Continuous Mounting

To mount in continuous rows, remove knockouts from end plates and fasten luminaires together by nipple and locknuts.

Maintenance

To restore Holophane Prismatic Glassware to its high initial operating efficiency is as simple as this:
1. Dip the glassware in an Oakite (or any common cleaning powder) and water solution. While the glassware is in the Oakite, very best results will be had if the glassware is scrubbed with a brush.
2. Rinse in clear water. 3. Set in a clean place to dry. (With a cleaning project of any size, the first lens will be dry by the time the last one gets out of the rinse.)

GENERAL ELECTRIC "RECESSED STATESMAN"

Recessed Statesman — Individual Mounting

Cross Section of No. 3045

The recessed Statesman is exceptionally modern and attractive in appearance. The curved type Holophane Control lens directs the light to the working plane at high efficiency and with uniform low brightness. A small portion of the light is

directed to the ceiling, in order to reduce brightness ratios. This luminaire may be installed as individual units, or to give unbroken lines of light.

Reflectors are accurately contoured for correct lamp focusing. Lamps can quickly be replaced by tilting out the four Holophane Control lens. The luminaire can be installed in very shallow recesses as the depth of the housing is only $5\frac{1}{4}$ inches.

Housing is of heavy gauge steel with a removable reflector which permits access to the ballast and wiring. Knockouts are provided at top and ends. End plates are separate and are fastened to housing by two bolts. Face plates and reflecting surfaces are finished in baked white enamel; exposed portion of end plates is polished cast aluminum. Luminaire is supplied wired, complete with FS-40 starters and approved high power factor ballasts.

GENERAL ELECTRIC "RECESSED STATESMAN"

COMPONENT PARTS

SUGGESTED INSTALLATION METHODS

Showing method of installing units by fastening directly to side framing members.

Showing method of installation using hanger assembly No. 3059 attached to wood framing member.

Showing method of installation using hanger assembly No. 3059 attached to channel iron framing member.

The recessed Statesman includes hangers and end plates to meet a variety of ceiling conditions. Their use will simplify installation and insure satisfactory lighting results. The exploded view tells at a glance how these component parts are assembled. Several methods of hanging are possible, but the use of hanger assembly, Cat. 3059, is recommended.

In single unit installations, either two light or three light, the basic unit, Cat. No. 3044 or 3045, must be equipped with two end plates, Cat. No. 3046, and with two hanger assemblies, Cat. No. 3059 which are optional.

In continuous row installations the basic unit

Cat. No. 3044 or 3045 requires one end plate Cat. No. 3046 at each end of the row, making two in all. The number of hanger assemblies Cat. No. 3059 will be one more than the number of basic units in the row as shown in the spacing guide on the next page.

Since there is no end plate used between adjoining units in a continuous row, a connecting strap is provided across each end of the housing. Two slotted holes are provided in each strap by which adjoining units may be bolted together. At the end unit in each row, the end plate Cat. No. 3046 is attached to this connecting strap before the unit is set in place.

GENERAL ELECTRIC "RECESSED STATESMAN"

Extended Run (8 feet) Consisting of Two Recessed Statesman Luminaires

Spacing Guide for Hanger Bracket No. 3059 in Continuous Rows

Spacing

Because of today's demand for high illumination levels, fluorescent units are usually closely spaced or ganged together in continuous runs. Maximum permissible spacing is, therefore, of little interest except where uniform illumination of a low level is required. In that case, the units may be spaced as far apart as 1.25 times their mounting height above the work.

Brightness

The brightness of these units in the glare zone is very low. Typical values in candle power per brightest square inch projected area are:

Angle from vertical	60°	70°	80°
No. 3044	1.8	0.9	0.7
No. 3045	2.2	1.1	1.0

GENERAL ELECTRIC "GRENADIER"

Grenadier II—Eight Foot Canopy Type

Grenadiers provide a type of diffused lighting which is generally recognized to be efficient. Diffusion is secured and the surface brightness of the lamps is masked by a well designed louver which provides 35° shielding normal to the lamp and 25° parallel. The metal-framed plastic side panels and optional top reflector plates described below, complete the requirement of controlling the light and directing it where it is desired.

Two models are available: the Grenadier II, which utilizes two 40 W. fluorescent lamps in each 4' section; and the Grenadier IV using four 40 W. lamps in each 4' section. Both models can be used together, since they are alike except for width. Grenadier II is available in three styles: Stem, Canopy and On-Ceiling types. Grenadier IV is available in Stem and On-Ceiling types only. Each type may be installed in continuous runs if desired.

The On-Ceiling type of installation is particularly desirable in rooms with lower ceiling heights. The Canopy type of suspension is recommended for rooms having average height ceilings and the Stem type of suspension accommodates rooms with higher ceilings. On the latter two models the distribution of light may be regulated to a degree, at your option, by specifying that your Grenadiers be furnished:

1. Without top plate reflectors, thus securing approximately 50% of light on the ceiling for Grenadier II (55% for Grenadier IV); or
2. With slotted top plate reflectors which distribute about 92% of the light downward and 8% up; or
3. With solid top plate reflectors which distribute 100% of the light downward.

Thus the Grenadier may be used to secure

Grenadier II—Eight Foot On-Ceiling Type

GENERAL ELECTRIC "GRENADIER"

Grenadier II—Eight Foot Stem Type

a satisfactory lighting result under varying room conditions.

All metal parts of the Grenadier are beautifully finished in a new, soft, metallic satin. Metal-framed plastic side panels become a luminous white color when the lamps are turned on. Side panel, louver and channel cover are easily removed, thus facilitating maintenance. Grenadiers are designed with all reflecting surfaces turned downward so that they collect a minimum of dust particles.

Grenadier IV—Four Foot Stem Type

Luminaires are supplied wired, complete with FS-40 Watch Dog starters and approved tulamp high power factor ballasts. They are available for 60 cycle 110-125 volt operation only. Overall suspension to bottom of reflector: Grenadier II—Stem type 24", Canopy type $8\frac{1}{8}"$, On-Ceiling type $4\frac{5}{8}"$. Grenadier IV—Stem type $25\frac{1}{8}"$, On-Ceiling type $5\frac{15}{16}"$.

The Single Unit

Small rooms and corridors frequently require single 4' units to match continuous installations in large rooms. Grenadier II single units are made in Stem, Canopy and On-Ceiling styles. Grenadier IV single units are available in Stem and On-Ceiling styles.

Even in the single units, lamps are easy to replace as the louver and channel cover are fastened at the ends with spring clips and are easily removed when clips are released.

GENERAL ELECTRIC "GRENADIER"

ORDERING INFORMATION

Grenadier II

Continuous runs of the Grenadier II are made up of bodies, end cap assembly, and either No. 20 strap assembly (On-Ceiling Type), No. 23 ceiling canopy assembly (Canopy Type) or No. 24 single stem assembly (Stem Type). When ordering continuous runs for an installation, specify (for each row) (a) one No. 25 end cap assembly, (b) the required number of bodies, and (c) the same number plus one of No. 20 strap assembly, or No. 23 ceiling canopy assembly, or No. 24 single stem assembly.

For example, if there are six Grenadier II On-Ceiling type fixtures in a row, itemize as follows:

- 6—No. GRL-248-B Bodies with louvers and plastic side panels.
- 7—No. 20 Strap assemblies (Substitute No. 21 for each outlet box in run).
- 1—No. 25 End cap assembly.

Or for six Canopy type fixtures in a row:

- 6—No. GRL-248-B Bodies with louvers and plastic side panels.
- 7—No. 23 Ceiling canopy assemblies.
- 1—No. 25 End cap assembly.

Or for six Stem type fixtures in a row:

- 6—No. GRL-248-B Bodies with louvers and plastic side panels.
- 7—No. 24 Single stem assemblies.
- 1—No. 25 End cap assembly.

The Grenadier II for individual mounting consists of one No. GRL-248-B body, one No. 25 end cap assembly, and either two No. 20 strap assemblies, or one No. 23 ceiling canopy assembly, or one No. 22 double stem assembly.

Top plate reflectors No. 29 and 30 should be specified separately when required.

Grenadier IV

Continuous runs of the Grenadier IV are made up of bodies, end cap assembly, and either No. 40 strap assembly (On-Ceiling Type) or No. 44 single stem assembly (Stem Type). When ordering continuous runs for an installation, specify (for each row) (a) one No. 45 end cap assembly, (b) the required number of bodies, and (c) the same number plus one of No. 40 strap assembly or No. 44 single stem assembly.

For example, if there are six Grenadier IV On-Ceiling type fixtures in a row, itemize as follows:

- 6—No. GRL-448-B Bodies with louvers and plastic side panels.
- 7—No. 40 Strap assemblies (Substitute No. 41 for each outlet box in run).
- 1—No. 45 End cap assembly.

Or for six Stem type fixtures in a row:

- 6—No. GRL-448-B Bodies with louvers and plastic side panels.
- 7—No. 44 Single stem assemblies.
- 1—No. 45 End cap assembly.

The Grenadier IV for individual mounting consists of one No. GRL-448-B body, one No. 45 end cap assembly, and either two No. 40 strap assemblies, or one No. 12 double stem assembly.

Top plate reflectors No. 49 and 50 should be specified separately when required.

GENERAL ELECTRIC "GRENADIER"

LIGHTING DESIGN DATA

The tables given below indicate the number of square feet allowable per luminaire for varying interior conditions and for specific levels of illumination. To find the number of units required to light a room, divide the total square foot area by the proper figure chosen below. Figures are based on present databook ratings for 4500° white lamps.* Light finish means a ceiling reflection of 75%, walls 50%; medium finish indicates ceiling 50%, walls 30%. Careful use of these data will provide the desired result.

Utilization Factors

This brings together all of the factors that affect the utilization of light. The figure obtained by reference to the table (for the type of fixtures used, the size and finish of the room in which these are to be installed) is the percentage of the lumens given out by the lamps that reaches the working plane. For example, a Utilization Factor of .40 means that 40 per cent of the light is useful in producing foot-candles and that 60 per cent is absorbed by the walls, ceiling and the fixture itself.

GRENADIER II

LUMINAIRE				SQUARE FEET PER LUMINAIRE					
Luminaire Model	Lamps	M. F.	Average Footcandles in Service	Large Room Width 4 times height		Medium Room Width 2 times height		Small Room Width equals height	
				Light Finish	Medium Finish	Light Finish	Medium Finish	Light Finish	Medium Finish
Grenadier II Stem Type	Two 40-W Fluorescent 4500° White*	0.70	30	56	45	47	38	37	29
			40	42	34	35	29	28	22
			50	34	27	28	23	22	18
			60	28	23	24	19	19	15

GRENADIER IV

LUMINAIRE				SQUARE FEET PER LUMINAIRE					
Luminaire Model	Lamps	M.F.	Average Footcandles in Service	Large Room Width 4 times height		Medium Room Width 2 times height		Small Room Width equals height	
				Light Finish	Medium Finish	Light Finish	Medium Finish	Light Finish	Medium Finish
Grenadier IV Stem Type	Four 40-W Fluorescent 4500° White*	0.70	30	106	84	88	71	69	55
			40	79	63	66	53	51	41
			50	64	51	53	42	41	33
			60	53	42	44	35	34	27

*Square feet per luminaire values will be 10 per cent higher for 3500° white lamps, 9 per cent lower for daylight lamps, and 18 per cent lower for soft white lamps.

GENERAL ELECTRIC "GRENADIER II SPOT"

On-Ceiling Type Grenadier II With GR-1150 Installed

The Grenadier II equipped with spotlight has been developed for practical use in stores, in order to provide regular lighting and "spot" lighting from a single fixture. The "spot", which takes a 150 W. PAR-38 lamp with side prong base, is inserted in

gimbals which permit a 35° adjustment in any direction. The lamp has 45° shielding. The louvers are finished in jet black to eliminate distracting bright spots, and the body is finished in the exclusive Grenadier metallic satin.

GENERAL ELECTRIC "GRENADIER IV SPOT"

On-Ceiling Type Grenadier IV With GR-2150 Installed

Similar to the Grenadier II "Spot", except that each section is equipped with two side by side "spots" instead of one spot, this unit is also very desirable for stores since it supplies regular lighting and "spot" lighting from a single fixture. The two "spots", each with a 150 W. PAR-38 lamp with side prong

base, are inserted in gimbals permitting a 35° adjustment in any direction. The lamps have 45° shielding. The louvers are finished in jet black to eliminate distracting bright spots, and the body is finished in the exclusive Grenadier metallic satin to match the regular Grenadier units.

GENERAL ELECTRIC "STAR"

The Star — Continuous Mounting

Modern artificial lighting strives for two objectives: first, an even distribution of light intensity all over the room, and second, the elimination of spheres of brightness contrasted with intervening dark areas. The newest approach to this twofold objective is the Star, a new luminous indirect lighting unit.

The Star utilizes a molded translucent Plaskon reflector of such density that the lighted luminaire is of approximately the same brightness as the illuminated ceiling. When Star units are used in continuous runs, spaced in accordance with General Electric engineering specifications, an evenly lighted ceiling is achieved which provides the sky-like effect of evenly distributed light, with no deep shadows or sharp contrasts and without distracting glare from the light source.

Description of the Star

Each 4' Star section utilizes two 40 watt fluorescent lamps which are accessible from the top of the reflector. The molded reflectors and end caps are made of Plaskon, a plastic compound which is light in weight, non-electrostatic, non-shatterable, uniform in appearance and will not support combustion. All visible metal parts are finished in satin aluminum. The reflectors are held in place by illuminated satin aluminum supporting bands, and are easily slid in and out of place for maintenance purposes without disassembly of the unit. Fixtures are supplied wired, complete with FS-40 Watch Dog starters and approved tulamp high power factor ballasts. Overall suspension to bottom of reflector, 24 inches. Available for 60 cycle 110-125 volt operation only.

The Star — Single Unit

The Single Unit

Small rooms and corridors often can be adequately illuminated with single units. These units are 4' long and are identical with the 4' sections used in continuous runs except that single unit installations are equipped with twin stem suspension. The appearance of the single unit matches those which are used in continuous runs in every other detail.

GENERAL ELECTRIC "STAR"

ILLUMINATION PERFORMANCE

The Star is a fine piece of engineered lighting equipment but misapplication will result in dissatisfaction. Therefore, the same consideration should be given its installation as when any other important addition or investment is made to the office, drafting room, or school. The table below sets up the minimum requirements for fine lighting results. It should be followed.

Minimum Room Area: 12' x 24'
 Ceiling Height: 10' to 14'
 Ceiling Conditions: Clean or newly painted with reflection above 75%.
 Side Walls: Pastel colors of reflection not less than 50%.

Utilization Factors

This brings together all of the factors that affect the utilization of light. The figure obtained by reference to the table (for the type of fixtures used, the size and finish of the room in which these are to be installed) is the percentage of the lumens given out by the lamps that reaches the working plane. For example, a Utilization Factor of .40 means that 40 per cent of the light is useful in producing foot-candles and that 60 per cent is absorbed by the walls, ceiling and the fixture itself.

ORDERING INFORMATION

Continuous Rows

Continuous runs of the Star are made up of bodies, reflectors, stem assemblies and end caps. When ordering continuous rows for an installation, specify the same number of body and reflector assemblies as there are units in each row. As many single stem assemblies as bodies, plus *one*, are required for each row. One set of end caps completes the row. For example, if there are eight Star units in a row, itemize order as follows:

8—No. STA-248-B Body and reflector assemblies.

9—No. 14 Single stem assemblies.

1—No. 15 End cap assembly.

Single Units

The Star unit specified for single mounting should always be supplied with No. 12 double stem assembly in addition to the STA-248-B body and reflector assembly and the No. 15 end cap assembly.

GENERAL ELECTRIC "STAR"

Using Slimline Lamps

A view of a section of an 8-foot Star Unit without reflectors, showing utilization of Slimline lamps. The complete unit, when enclosed, is identical with the illustration on page 10.

This latest development in the design of the Star, making it available for use with four 8' Slimline lamps, permits installations providing more lumens per foot of fixture. There are certain room conditions under which the use of the Star with Slimline lamps will result in fewer fixtures, spaced farther apart, with a satisfactory lighting result being achieved. Units may be ordered for use either with 200 MA. lamps or 300 MA. lamps (see catalog specifications below). Available for 60 cycle 110-125 volt operation only. No. 14 stems are spaced at approximately 4' intervals to insure adequate support.

Illumination Measurements

These measurements are based on an installation after 100 hours of use. Walls: light gray stipple over coral undercoat, .50 reflection factor. Ceiling: white, .87 reflection factor. Ceiling height: 11.8'. General Electric Stars with 96T8 Slimline lamps mounted 21" from ceiling to top of units. Three rows 16' long, 8 lamps per row. 117 volts on line at switch panel. 60.9 average footcandles on work plane 31" above floor.

Cross Section

X—Stations where footcandle readings were taken.

Purchase Information

Each 8' section requires 3 No. 14 single stem assemblies and 1 No. 15 end cap assembly. For continuous runs, specify the required quantity of No. 14 stem assemblies spaced every 4' of fixture length and at ends of rows, together with 1 No. 15 end cap assembly for each row.

†Cat. No.	Price Each	Cycles	Lamp Current (M.A.)	Lamps	Description	Std Susp	Ship. Wt

Lamps are not included in prices.

For additional length hanger, add \$1.00 per foot or fraction.

GENERAL ELECTRIC "AMBASSADOR" USING 4-40 WATT FLUORESCENT LAMPS

Ambassador with Lenses

The Ambassador provides evenly distributed, comfortable illumination which makes possible quicker and more accurate seeing in stores, schools and offices, resulting in more sales and happier customers, faster and more efficient work, and reduced fatigue. It is an exceptionally beautiful luminaire, designed to blend harmoniously with modern interiors.

The Ambassador is available with fresnel lenses, which provide excellent diffusion, or with a metal louver of unusual beauty. The louver provides 45° crosswise and 30° lengthwise shielding.

Construction

Dependable service is ensured by the use of heavy gauge metal, finished in hard baked white enamel. Lamp replacements can quickly and easily be made by means of the hinged door frame. Spring fasteners readily unfasten the door, or securely lock it in place. Housing is ventilated to ensure proper cooling of ballasts. All auxiliary equipment is mounted in the housing for ease of installation and maintenance. Luminaire is provided with six slotted holes and three knockouts for mounting on ceiling.

Continuous Mounting

To mount in continuous rows, remove knockouts

from end plates and fasten luminaires together by nipple and locknuts.

Auxiliary Equipment

Luminaire is supplied wired, complete with FS-40 Watch Dog starters and approved tulamp high power factor ballasts which reduce stroboscopic effects to a minimum.

*Equipped with Instant Start ballasts (no starters required). Must be used with Instant Start lamps. Lamps are not included in prices.

GENERAL ELECTRIC "AMBASSADOR"

USING SLIMLINE LAMPS

Slimline Ambassador with Louver

A well designed lighting installation for offices, schools and stores should provide suitable intensities of uniform, glare-free illumination, without contrasting areas of brightness. Such an installation will promote better working conditions in offices and schools, with more accurate work and fewer errors. A properly lighted store invites shoppers to come in. It makes merchandise easier to see and appraise, easier to buy.

The Ambassador for use with slimline lamps makes possible these benefits by providing adequate quantities of cool illumination at high efficiencies. This luminaire is available with fresnel lenses, which provide excellent diffusion, or with a metal louver which provides 45° crosswise and 30° lengthwise shielding.

The Slimline Ambassador accommodates four 96 inch slimline lamps, and may be obtained for 200 or 300 milliamperes operation on 60 cycles, and for 200 milliamperes operation on 25 cycles.

Slimline lamps are highly efficient in operation, and do not require starters, thus making possible instant starting. In continuous row installations, these long light sources reduce the number of dark areas between lamps. Maintenance is simplified, since fewer lamps are required, and spring-type lamp-holders provide for easy lamp insertion and removal.

Construction

Dependable service is ensured by the use of heavy gauge metal, finished in hard baked white enamel.

Lamp replacements can quickly and easily be made by means of the hinged door frames. Spring fasteners readily unfasten the doors, or securely lock them in place. Luminaire is provided with six slotted holes and three knockouts for mounting on ceiling. To mount in continuous rows, remove knockouts from end plates and fasten luminaires together by nipple and locknuts. Luminaire is supplied wired, complete with approved tulamp high power factor ballasts.

GENERAL ELECTRIC TROFFERS

Continuous Row Installation of Open Type Troffers

General Electric Troffers provide good quality illumination for easy, comfortable seeing at reasonable cost. They may be installed as individual units, or bolted together through housing ends to form continuous rows or patterns of light.

The open type troffer, which has a shielding angle of 17° crosswise, is designed for use in locations where lamp shielding is not considered necessary. This troffer is provided with hinges and fasteners to accommodate hinged louver or glass panel assemblies which may be installed initially or added at any future time.

Reflector is readily detached from housing by quick-release cam-type fasteners. When the reflector is removed, ballast and wiring are exposed for ease of maintenance and installation. Starters

located between lamps are readily accessible without removing lamps. Reflector and housing are made of heavy-gauge metal, finished in white baked enamel. Troffers accommodate two 40 watt lamps, and are supplied wired, complete with FS-40 Watch Dog starters and approved tulamp high power factor ballasts.

Purchase Information

To order troffers with louver or glass panel assembly, specify the required open housing assembly as a separate item, together with the louver or glass panel assembly. One No. 692 end plate assembly will be required for each row of troffers, or for each individually mounted troffer.

GENERAL ELECTRIC TROFFERS

HINGED LOUVER ASSEMBLY

The use of this louver assembly makes possible high intensities of illumination with low brightness contrasts between the ceiling and the troffer, when viewed at normal angles. The louver provides 45° crosswise and 30° lengthwise shielding.

The assembly swings from the housing on two concealed safety-type hinges, and closes securely by means of two quick-release cam-type fasteners. Although readily removable from the housing without tools, it cannot become accidentally detached. Made of heavy-gauge metal, finished in white baked enamel.

HINGED GLASS PANEL ASSEMBLY

Excellent lamp shielding and a pleasing appearance is provided by this glass panel assembly. The single panel of Alba-lite glass is homogeneous in composition, with a permanent, uniform color and easy-to-clean surface.

The panel is mounted in a rigid, steel frame and held securely in place by bronze spring clips. The glass panel assembly uses the same method of hinging and fastening to the housing as the louver assembly. To prevent light leak, two brackets for bolting to the housing ends are provided. Frame is finished in white baked enamel.

To use the table above, locate the required foot-candle value opposite the room dimensions and under the ceiling height. Above this foot-candle figure will be found the area per two-lamp unit and the spacing of rows for a continuous row installation.

Figures are based on the use of two 60 cycle 4500°K white lamps per lighting unit. For 60 cycle 3500°K white lamps multiply values by 1.09. For 60 cycle 6500°K Daylight lamps multiply values by .91. For 25 cycle lamps multiply 60 cycle values by .95.

The tables assume light coloured surroundings, 75% or better reflection factor of ceiling and 50% for walls. For 30% walls reduce average foot-candle values by 5 per cent except in very large rooms, where the reduction is 3%. Foot-candles are calculated "in-service" values using a maintenance factor of .70 which allows 30 per cent for depreciation due to dust collection and ageing of lamps.

GENERAL ELECTRIC TROFFERS

MOUNTING ACCESSORIES

No. 694 Chain Suspension Bracket

No. 695 Mounting Hanger

No. 5200 Hanger Clamp

No. 5201 Junction Box Clamp

No. 694 Chain Suspension Bracket

For use when troffer is supported from structural ceiling by wire or chain. Threaded studs are supplied with wing-nuts, to enable troffer to be easily levelled flush with ceiling-line.

No. 695 Mounting Hanger

Can be bolted, through adjustment holes in legs, directly to wood, angle iron, or channel iron furring. For certain types of ceiling construction special suspension clamps or straps can be supplied at extra cost; further information on request. Provided with hole for $\frac{1}{2}$ inch conduit.

No. 696 Wiring Channel

Provides a wire-way for through circuit wiring, when it is not desirable to bring wiring through ballast housing. Supplied with four weld-bolts and wing-nuts for supporting troffer. Shoulder accommodates sliding hanger clamp which can be located at any point. Channel is equipped with brackets for bolting together in continuous runs.

No. 697 Wiring Channel End Plate Assembly

Consists of two end plates for closing off No. 696 wiring channel at ends of runs.

No. 5200 Hanger Clamp

For use with No. 696 Wiring Channel. Clamp fastens securely to shoulder of channel by turning down one bolt. Supplied with hole for $\frac{1}{2}$ inch conduit.

No. 5201 Junction Box Clamp

Similar to No. 5200, except that it is supplied with enclosing side plates for use with conduit containing wiring.

GENERAL ELECTRIC TROFFERS

INSTALLATION DATA

Troffer supported from structural ceiling by means of chain or wire fastened to No. 694 Chain Suspension Bracket.

Troffer supported from wood furring. Shoulder of troffer is provided with two 1/4 inch knockouts on each side for securing troffer to furring.

Troffer supported from structural ceiling by conduit and No. 5200 Hanger Clamp, which clamps rigidly to No. 696 Wiring Channel.

Mounting Hanger No. 695 supporting troffer and ceiling furring. Hanger is hung from the structural ceiling by conduit or rod suspension. Furring is bolted to the legs of the hanger. At least one mounting hanger is required for each 4-foot troffer section, plus one for the end of the row.

Troffer supported from structural ceiling by means of 1/2 inch conduit, secured by locknuts through knockouts in top of housing.

Mounting Hanger No. 695 supporting troffer only. Furring is bolted to the legs of the hanger through whichever adjustment hole brings the troffer flange flush with the ceiling. At least one hanger is required for each 4-foot troffer section, plus one for the end of the row.

GENERAL ELECTRIC "DIPLOMAT"

Suspension Type Diplomat

The Diplomat makes possible modern economical lighting that results in increased production, greater efficiency and reduced costs. Adequate quantities of cool, glare-free light reduce eyestrain and fatigue, and promote easier, faster and more accurate seeing.

The Diplomat is suitable for use in offices, schools, stores, and public buildings — its clean, refreshing lines harmonizing with all interiors. Attractive side panels of etched, ribbed glass and a louver of unusual beauty adequately shield the light source.

This luminaire is easily and quickly installed either individually or in continuous rows. Maintenance is

simplified because there are few horizontal surfaces on which dust can collect. Lamp replacements are made easily — by swinging open the strong, hinged louver. Removal of glass panels is unnecessary.

The Diplomat is manufactured in two models, the Suspension Type and the Ceiling Type. Both of these models are available for operation with two, three or four 40 watt lamps.

The luminaire is supplied wired, complete with FS-40 Watch Dog starters and approved high power factor ballasts which reduce stroboscopic effects to a minimum.

†For semi-ceiling mounting of 25 cycle fixtures.

‡Hanger length only, ceiling to top of fixture. Overall suspension to bottom of fixture, 12 $\frac{1}{2}$ inches.

For additional length hangers, add \$1.00 per foot or fraction.

Instant-start Ballasts available for 60 cycle 110-125 volt operation (no starters required).

2-40 watt Ceiling Type, Cat. 6323—\$39.25 each.

4-40 watt Ceiling Type, Cat. 6303—\$62.50 each.

Lamps are not included in prices.

GENERAL ELECTRIC "DIPLOMAT"

Continuous Mounting of Ceiling Type

Continuous Mounting

Both the Suspension Type and the Ceiling Type Diplomat may be installed in continuous runs.

Simply remove knockout from end plates and connect units with $\frac{1}{2}$ inch nipple and locknuts.

Important Features

1. Equipped with twist-type sockets mounted slot-up, so that lamps cannot fall out.
2. Wire-way cover is held in place by four screws with slotted holes for accessibility.
3. All metal parts finished in baked ivory enamel; reflecting surfaces in baked white enamel.
4. Slots in steel end plates are backed with translucent plastic to give luminous appearance.
5. Lamps can be replaced from top or bottom without removing glass panels.
6. Maintenance is simplified by easily removed louver. Starters readily accessible between lamps.
7. Attractively-designed stamped canopy has knockout for switch. Stems and canopy finished in satin aluminite.
8. Well-designed corrugated cartons ensure safe transportation of luminaire.

CANADIAN
GENERAL ELECTRIC

GENERAL ELECTRIC "BRIGADIER"

Suspension Type Brigadier

The Brigadier provides uniform diffused lighting for schools, offices, stores and similar locations. Lamps are shielded by means of plastic side panels and a well-designed louver. The open top reflector makes possible suitable illumination of the ceiling, thus reducing brightness contrasts within the field of view.

This luminaire is particularly suited for school and office use, since the side panel brightness is very low. The resultant low brightness ratios make possible quick, accurate seeing with a minimum of effort.

The proportions of the Brigadier are such that it provides a light source of low brightness and relatively large area, yet it is singularly neat and unobtrusive in appearance.

The Brigadier is available in two models, the

Ceiling Type and the Suspension Type. Each model may be installed in continuous runs if desired. The Ceiling Type consists of a body and ceiling canopy assembly. The Suspension Type consists of a body and rod hanger assembly. When ordering, the two component parts must be specified as separate items.

Construction

Each Brigadier body uses four 40 watt fluorescent lamps which are accessible through the top of the reflector without removing the louver. The housing is ventilated to secure proper cooling of ballasts. Starters are accessible without removing lamps. The louver can easily be unsnapped from housing so that ballasts and wiring can be reached. Maintenance is speeded by the simple yet sturdy design of the louver.

6699	3.30	Rod hanger assembly	19 $\frac{1}{8}$	3

For additional length rod hanger add \$1.00 per foot or fraction.

*Equipped with Instant-Start ballasts (no starters required). Must be used with Instant-Start lamps. Lamps are not included in prices.

GENERAL ELECTRIC "BRIGADIER"

Ceiling Type Brigadier

All metal parts are beautifully finished in baked ivory enamel; reflecting surfaces and louver are finished in baked white enamel. Side panels are of translucent plastic which takes on a warm ivory color when lamps are lighted. Canopy and stems are finished in satin aluminite.

Overall suspension to bottom of reflector: Ceiling type, $8\frac{9}{16}$ inches; Suspension type, 24 inches.

Installation

Ceiling canopy assembly is fastened to housing by means of four screws which project from top of housing. Rod hanger assembly is supplied with channel adapter which also secures to these screws.

Cross Section of Suspension Type

Ceiling strap is provided for fastening either type of fixture to ceiling. A hickey, locknut and nipple are included for mounting on outlet box stud.

Continuous Mounting

To mount in continuous rows, first remove knock-outs from end plates. Then remove plug buttons from two holes in each end plate, and bolt fixtures together through these holes.

Auxiliary Equipment

Luminaire is supplied wired, complete with FS-40 Watch Dog starters and approved tulamp high power factor ballasts which reduce stroboscopic effects to a minimum.

Cross Section of Ceiling Type

GENERAL ELECTRIC "MODEL 6900" LUMINAIRE

Suspension Type With Shield

Suspension Type Without Shield

Distinctive and modern in appearance, this four lamp luminaire provides cool illumination at high efficiencies. It is particularly suitable for stores, offices, schools and similar areas. A feature is the use of glass end plates which spread a pleasing luminous glow. Complete shielding of the lamps can be obtained by a shield made of ribbed Albalite diffusing glass. This shield can be readily installed initially or may be added at any future time. Luminaire may be mounted on the ceiling or suspended by rods.

Construction

Reflector and ceiling pan are made of heavy gauge

metal, finished inside and out in baked white enamel. Rod hanger assembly is finished in satin aluminite. All auxiliary equipment is mounted in the reflector, which is securely attached to the ceiling pan by means of four cam-type fasteners. These fasteners can be operated quickly and easily with only a quarter turn. When detached from ceiling pan, the reflector assembly hangs by two chains, to facilitate installation. The end plates prevent lamps from falling. To relamp, simply remove end plates by loosening two thumb screws. Starters are accessible without removing lamps.

Installation

For suspension mounting, brackets are provided

NOTE: When ordering Suspension Type, specify as two items, namely: Ceiling Type and Rod Hanger Assembly.

*Not recommended when fixture is mounted on ceiling.

†Hanger length only, ceiling to top of fixture. Overall suspension to bottom of fixture, 30 inches. For additional length hanger add \$1.00 per foot or fraction.

‡Equipped with instant start ballasts (no starters required). Must be used with instant start lamps.

Lamps are not included in prices.

GENERAL ELECTRIC "MODEL 6900" LUMINAIRE

Ceiling Type

Plan Showing Mounting Holes

Cross Section

on the ceiling pan through which the rods are secured by locknuts. Fixture strap can be mounted on outlet box, or fastened directly to the ceiling.

To mount luminaire on ceiling, remove brackets, release cowl fasteners, and unhook chains. Ceiling pan can now be fastened to ceiling, and circuit wires brought down through one of the four knockouts provided. Attach chains to the lugs in ceiling pan, make the necessary connections, and secure reflector assembly to ceiling pan by the cowl fasteners.

Continuous Mounting

The glass end plates with which "Model 6900" luminaires are equipped do not permit mounting in

continuous rows. Metal end plates finished in baked ivory enamel will be supplied on request, at no extra charge, whenever it is desired to install these luminaires in continuous runs. Specify one No. 6998 end plate assembly for each fixture.

Glass shield No. 6901 cannot be used with these metal end plates.

Auxiliary Equipment

Luminaire is supplied wired, complete with FS-40 Watch Dog starters and approved tulamp high power factor ballasts which reduce stroboscopic effects to a minimum.

* Foot-candles are calculated in-service values, using maintenance factor of .70 which allows 30% for depreciation due to dust collection and ageing of lamps.

† This tabulation applies where average mounting heights of 9½ to 11½ feet are used. Figures are based on the use of 4 - 40 watt, 60 cycle 4500°K White lamps per luminaire. For 60 cycle 3500°K White lamps multiply values by 1.1. For 60 cycle 6500°K Daylight lamps multiply values

by .91. For 25 cycle lamps multiply 60 cycle values by .95.
‡ Light—Ceiling 75% or better Reflection Factor, Walls 50%.
Medium—Ceiling 50% Reflection Factor, Walls 30%.
Dark finishes not recommended.
§ Wide—Room Width is 4 times mounting height of units above floor.
Medium—Room Width is 2 times mounting height of units above floor.
Narrow—Room Width is about equal to mounting height of units above floor.

CANADIAN
GENERAL ELECTRIC

GENERAL ELECTRIC "MODEL 6920" LUMINAIRE

Suspension Type With Shield

Suspension Type Without Shield

This two-lamp luminaire is similar in appearance to the four-lamp model described on page 50. Very neat and pleasing in design, it finds ready application in lighting small stores, kitchens, hallways and similar locations. Glass end plates provide a soft luminous glow and prevent lamps from falling out. Complete shielding of the lamps can be obtained by an Alba-lite glass shield which can be installed initially or may be added at any future time.

Construction

Reflector and ballast cover are made of heavy

gauge metal, finished inside and out in baked white enamel. Rod hanger assembly is finished in satin alumilite. All auxiliary equipment is mounted in the reflector, which securely fastens to the ballast cover by two cam-type fasteners. Sockets are mounted on rigid metal platform, to assure accurate socket spacing. Starters are accessible without removing lamps.

Installation

Fasten ballast cover to ceiling and bring circuit wires down through knockout in centre; or for sus-

NOTE: When ordering Suspension Type, specify as two items, namely: Ceiling Type and Rod Hanger Assembly.

*Hanger length only, ceiling to top of fixture. Overall suspension to bottom of fixture, 30 inches. For additional length hanger add \$1.00 per foot or fraction.

†Equipped with instant start ballasts (no starters required). Must be used with instant start lamps.

Lamps are not included in prices.

GENERAL ELECTRIC "MODEL 6920" LUMINAIRE

Continuous Mounting

Ceiling Type Without Shield

pension mounting, secure rods to cover with lock-nuts. Next, bring the reflector assembly up and close the cover plates, thus allowing assembly to hang on legs of ballast cover. Complete connections, secure reflector assembly tightly to ballast cover by means of the two cowl fasteners, and install end plates.

Continuous Mounting

The glass end plates with which "Model 6920" luminaires are equipped do not permit mounting in continuous rows. Metal end plates finished in baked ivory enamel will be supplied on request, at no extra charge, whenever it is desired to install these luminaires in continuous runs. Specify one No. 6997 end plate assembly for each fixture.

Glass shield No. 6912 cannot be used with these metal end plates.

Auxiliary Equipment

Luminaire is supplied wired, complete with FS-40 Watch Dog starters and approved tulamp high power factor ballast which reduces stroboscopic effects to a minimum.

GENERAL ELECTRIC SHOW WINDOW LUMINAIRE

Show Window Luminaire Without Louver

Application

More customers and increased sales are the result when show windows are sufficiently well-lighted to attract the attention of the passers-by to the merchandise displayed. The necessary intensity of illumination is efficiently and economically provided by a properly designed installation of General Electric show window luminaires. Functional in design, yet pleasing in appearance, these luminaires will more than repay their cost in the added business obtainable through the increased attraction of the show window.

Construction

Lamps are deeply recessed in the reflector,

thus providing excellent shielding. In order to direct the light to the centre of the display, the reflector is at an angle of 12 degrees to the horizontal. All auxiliary equipment is mounted in the housing for ease of installation and maintenance. Sturdy one-piece reflector is easily detached from housing by four wing nuts, without disturbing wiring. Starters are readily accessible without removing lamps. Heavy gauge metal is finished inside and out with hard baked white enamel.

Louver

An attractively-patterned hinged louver is available for use with General Electric show window luminaires. This louver prevents direct viewing of

 Lamps are not included in prices.

GENERAL ELECTRIC SHOW WINDOW LUMINAIRE

Show Window Luminaire With Louver

the lamps by persons on the street as well as by those in the main display area of the store, particularly where the show window is open to the store. By thus eliminating distracting glare, full attention is directed to the merchandise on display.

The louver may be installed initially, or it can be added at any future time. Luminaires are supplied already drilled for hinges and spring clips, which are supplied with the louver. Installation can simply and quickly be effected. Louver swings clear for easy lamp replacement. Strongly constructed of heavy gauge metal, finished in baked white enamel.

Installation of Luminaire

May be mounted flush or suspended. Housing has two knockouts for $\frac{1}{2}$ inch conduit, on 30 inch centres. Four $\frac{5}{16}$ inch holes are provided

for ceiling mounting. During installation, reflector is easily removed making all wiring accessible for connections. For recessing, angle brackets will be supplied on special order, at no extra charge.

Continuous Mounting

To mount in continuous rows, remove knockouts from end plates and fasten luminaires together by nipple and locknuts. Conduit can be connected between luminaires, through holes in end plates, to provide continuous wiring with any spacing of luminaires.

Auxiliary Equipment

Luminaire is supplied wired, complete with FS-40 Watch Dog starters and approved tulamp high power factor ballasts which reduce stroboscopic effects to a minimum.

Cross Section (with Louver)

Plan Showing Mounting Holes

CURTIS "4060" LUMINAIRE

The low brightness of the "Forty-Sixty" luminaire blends with the illuminated ceiling, producing a comfortable field of vision. High levels of illumination without distracting and harmful glare are readily attained with this unit. Particularly recommended for offices, class-rooms and drafting rooms.

Light Control

The ceiling is illuminated by an indirect component of approximately 40% of the light output. The 60% direct component is louvered to provide 35° crosswise and 25° lengthwise shielding. Within the shielded zone maximum brightness does not exceed .3 candles per sq. in. crosswise or .6 candles per sq. in. lengthwise.

Construction

Aluminum and steel. Aluminum reflectors, louver fins, canopy, wiring channel and ends. Steel hanger stems. Plastic end ornament.

Reflectors, louver fins, wiring channel and end plates finished in white Fluracite. Ornamental star in Ivorytone. Hanger finished warm grey.

Louver is hinged and will swing down for cleaning and relamping or for access to the wiring channel. If desired, however, assembly can be completely removed by detaching two screws. Special 12 inch two-stem hanger permits easy installation. Other length hangers can be supplied where required.

Fixtures are furnished wired for 110-125 volt 60 cycle circuits with high power factor tulamp ballast and FS-4 starters. Total Watts: 95.

Maintenance

All-metal unit with no horizontal reflecting or diffusing surfaces to collect dust . . . designed to require minimum of cleaning. Lamps may be replaced without removing the louver.

Continuous Runs

For a continuous run with single-stem hangers located between sections and at the ends of the run, order one 4-foot basic unit and as many 4-foot extension sections as are needed to complete the run. Basic unit is packed with two hangers for the ends, extension section with one hanger. Wire

CURTIS "4060" LUMINAIRE

The "4060"—Continuous Mounting

entrance can be made through any hanger. Allow $48\frac{3}{16}$ inches on centres for spotting hangers except at ends where $44\frac{7}{16}$ inches on centres is allowed.

If continuous fixtures are wanted with centrally located two-stem hangers, order the same unit as for individual mounting. Connectors are furnished with all units. Allow $48\frac{3}{16}$ inches on centres.

"FORTY-SIXTY-ONE" UNIT

"Forty-Sixty-One" is the 5-foot, two 85-watt size of the "Forty-Sixty." This unit is identical in cross-section and construction with "Forty-Sixty" except that it is $60\frac{3}{4}$ inches long and arranged for use with two 85-watt lamps. Supplied wired with high power factor tulamp ballast and FS-64 starters. Total watts: 202.

Distribution is similar to that of the "Forty-Sixty." "Forty-Sixty-One" can also be furnished for continuous runs with single-stem hangers. Allow $60\frac{3}{16}$ inches on centres for spotting hangers except at ends of run where $56\frac{7}{16}$ inches is allowed.

For average conditions a maintenance factor of 75% is suggested.

Distribution Curve

Cross Section

CURTIS "ANNIVERSARY" LUMINAIRE

The "Anniversary" Luminaire is of the general diffusing type with the top completely open for better utilization of the indirect component. The direct component is shielded 30° lengthwise and crosswise by the attractive one-piece louver.

For four 40-watt lamps per section. Recommended for both store and office lighting, the "Anniversary" Luminaire can be used either as an individual unit or in continuous runs. It is an all metal unit with a very shallow body. Side panels are designed so that lamps are louvered and reflected light is utilized to illuminate and create a decorative effect. The graceful modern appearance is enhanced by the distinctive dart pattern visible from the underside of the luminaire.

Material and Finish

Made of steel with reflecting surfaces and louver finished white Fluracite. End plates and hanger finished light grey.

Dimensions

Width, 18"; overall depth, 4½"; depth of body, 3"; length, including end ornament, 51⅜". Standard suspension is 12", but stems for 18", 24", 36" and 48" suspensions are available on request. Net weight is 33 lbs.

Auxiliary Equipment

Luminaires are supplied wired for 110-125 volt 60 cycle operation with high power factor tulamp ballasts and FS-4 starters. Total watts, 198.

Installation and Maintenance

Curtis hangers permit simplified installation. Lamps and starters can be changed from above without opening the louver. Louver is hinged on both sides and is easily removed.

Since there are no horizontal reflectors or diffusing surfaces to collect dust, maintenance costs are inherently low.

CURTIS "ANNIVERSARY" LUMINAIRE

Dimensional Data

Hangers

Luminaire is packed complete, less hanger, in a specially designed carton. Catalogue number of luminaire less hanger is 51-CLH.

No. 51-CB consists of 51-CLH plus one No. 629 basic hanger set (comprises two single stem hangers and fittings complete in one carton).

No. 51-CE consists of 51-CLH plus one No. 630 single stem hanger, packed in separate carton.

No. 51-C consists of 51-CLH plus one No. 631 two-stem hanger, packed in separate carton.

Illumination Data

The photometric curve is reproduced below. The Coefficients of Utilization table given is derived from this curve.

Distribution Curve

Candlepower Distribution

The candlepower distribution of the "51" luminaire is such that only 5.4% of the bare lamp lumens are delivered in the 60°-90° zone. By keeping light in this zone at a low value, seeing comfort is greatly increased.

Efficiency

Light output of the "51" is such that this unit is classified as a "general diffuse lighting type fluorescent luminaire". The "51" has an overall efficiency of 78.3% of bare lamp lumens.

Brightness

The maximum brightness within the shielded zone of the "51" luminaire is 1.5 candles per square inch (678 foot-lamberts).

For average conditions a maintenance factor of 75% is suggested.

CURTIS "TRANQUILUX" LUMINAIRE

The Tranquilux and Tranquilouver are attractive, modern luminaires available for two, three or four 40-watt lamps. Recommended for use in offices, stores, schools and draughting rooms. Scientifically engineered for maximum efficiency and comfortable vision, they provide excellent working conditions at moderate cost to promote speed, accuracy, and increased production.

Tranquilux

To produce smooth, even, blended illumination the lamps are operated out of phase so that while some are at maximum brilliance others are reaching

minimum. In addition, frosted glass mixing shields are placed between the lamps to reduce brightness and further decrease flicker. For best results on 25 cycle circuits, lamps with coated ends should be used and where 3-phase power is available adjacent units should be connected to alternate phases. Lamps are well shielded from any normal transverse viewing angle by ribbed glass diffusing panels. Ease of maintenance is assured by the placing of all reflecting and diffusing elements in planes which minimize dust adhesion. All of these important surfaces are easy to clean and their hardness resists scratching or deterioration.

60 CYCLE		25 CYCLE		Lamp Watts	Dimensions (Inches)		Shipping Weight	
Cat. No.	Price Each	Cat. No.	Price Each		Width	Height	60 Cyc.	25 Cyc.

*For 120 volt, 3 Phase—for end to end use in pairs of units only.

†For 208 volt, 3 Phase.
Lamps are not included in prices.

Hangers not included—See Page 62.

CURTIS "TRANQUILOUVER" LUMINAIRE

Tranquilouver

This luminaire is similar to the Tranquilux with the exception that it is equipped with louvers instead of glass mixing shields. These louvers effectively conceal lamps from ordinary view, providing 35° crosswise and 25° lengthwise shielding. Scientifically designed with careful attention to proper mixing, they tend to reduce perceptible flicker. Surfaces are correctly slanted to lower brightness and to give a uniform large area source of illumination. Louvers may be purchased separately and will fit existing installations of Tranquilux luminaires which have the new end plate with perforated pattern.

Construction of Tranquilux and Tranquilouver

These units are built to ensure long life and trouble free performance. Made throughout of 18-gauge aluminum. All units may be mounted in continuous runs if desired. Simply remove ornaments and bolts from end plates, couple them together with chase nipple and locknut and replace bolts. Fixtures are wired complete with FS-4 starters and approved high power factor ballasts.

Finish

Finish is in Fluracite. This reflecting surface is a synthetic polymerizing high temperature baked enamel, glossy white and mineral hard — especially developed to maintain and not distort the colour value of the fluorescent lamp. Fluracite does not peel, chip or check even under severe conditions, yet possesses unusually high reflectivity and is easily cleaned with soap and water.

CURTIS "TRANQUILUX" AND "TRANQUILOUVER" LUMINAIRES

Methods of Suspension

For normal ceiling heights (11' 6" and lower) mount luminaires directly against ceiling. On higher ceilings, they may be suspended if desired. For good appearance and lighting results, the top of the housing should be from 10' to 11' above the floor.

One-Stem Hanger—Catalogue No. 624

This hanger is composed of a single steel stem 36" long with a self-aligning canopy fitting. The lower end is threaded, and a locknut, two heavy washers and clamping nut are included. A knockout in the top of the luminaire is provided for fastening to stem. Finish, aluminum lacquer.

Use at end of row in continuous runs containing an odd number of luminaires.

Two-Stem Hangers—Catalogue Nos. 626 and 627

These hangers consist of a cast canopy bar and

SUGGESTED HANGER PLANS

two steel tube stems. Stems are held at top and bottom by heavy cotter pins. Standard suspension is 36" from ceiling to top of luminaire which can be shortened easily on the job by cutting off stems to new length and drilling $\frac{1}{4}$ " hole in each stem.

Use No. 626 hanger for Nos. 6227-C, 6227-LC, 6247-C, 6247-LC, 6247-F and 6247-LF when hanger is at centre of unit or on all units when hanger is over junction between two units. Use No. 627 hanger for Nos. 6227-F, 6227-LF, 6237-C and 6237-LC. With No. 626 Hanger, be sure bottom plates are inside housing in position shown. Finish, aluminum lacquer.

A	.61	.58	.55	.59	.56	.54	.55	.53

The application of continuous fluorescent sources to general lighting problems is somewhat different than planning for luminaires on conventional outlet spacing. For this reason the footcandle charts shown have been prepared.

Constant footcandle values are obtained under a continuous section at points more than 12 feet in from either end. At the end of a long section, the values are one-half of those under the centre of a long section.

The chart shows how the intensities under single and continuous sections vary with mounting height. It is easy to determine the intensities between continuous sections by the use of the data given.

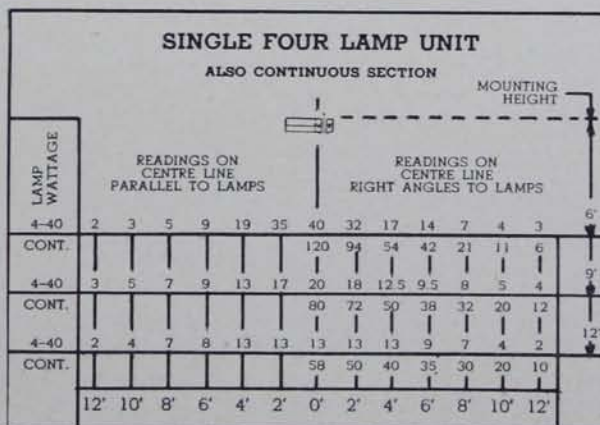

The charts have been compiled from tests on units mounted on a fairly light ceiling and are based on 3500° white lamps. For 4500° white lamps, decrease values by 10 per cent.

For daylight lamps decrease values by 15 per cent.

A maintenance factor of 75 per cent is suggested. This means the footcandle values over a period of time will be 75 per cent of those given in the tables.

For large interiors with average ceiling heights each watt (including ballasts), per square foot of floor area, will produce approximately 15 to 20 footcandles including a depreciation factor. For smaller rooms for each watt per square foot an average of 12 to 15 footcandles will result.

APPROXIMATE FOOTCANDLE VALUES

CURTIS TROFFERS

Continuous Row Installation of Louvered Troffers

These troffers are of two general types. They are equipped with side and end flanges and are easy to install in any type ceiling including T-Bar construction; however, the T-Bar clips are not used to support the unit.

General Construction Features

Wireway is suspended from "U" shape support brackets which are readily adjustable for thickness of framing and plaster or acoustical material. Reflectors are assembled to wireway with wing nuts and complete unit is drawn up to ceiling with long bolts. Sections can be wired together in lengths convenient for installation and installed as a unit. In general, one wire entrance will be sufficient for the entire run.

Dimensions

Each unit is exactly 48" long and fits into a 12" slot in the ceiling. This permits exact alignment of reflectors with acoustical ceiling patterns. Width at bottom over flanges, 13". Depth above finished

ceiling required for recessing, 9 $\frac{1}{4}$ ".

Carton Packed

All units, basic and extension, are unit carton packed complete for easy storage.

LOUVERED TROFFERS

These troffers are carefully designed for high efficiency and low brightness. Reflectors, wireway and louvers are made of heavy gauge aluminum with Fluracite (white) finish. Louvers are of the swing down type and provide shielding 35° cross-wise and 25° lengthwise.

GLASS BOTTOM TROFFERS

With Fluracite reflector and sliding glass panels. The general construction of these units is the same as the louvered types. Glass panels are of diffusing glass arranged to slide over each other for maintenance. Panels can be easily removed when necessary.

FLUORESCENT CURTISTRIP

Semi-Concentrating Reflector Fixture

Distributing Reflector Fixture

Cross Section

Cross Section

Semi-Concentrating Reflector Fixtures have deep symmetrical reflectors. They are intended for general or localized direct lighting over counters, cases and work tables.

Distributing Reflector Fixtures have shallow symmetrical reflectors which spread the light over a wide area. They are for general direct lighting, local lighting when mounted below eye level, and for indirect lighting.

Directional Reflector Fixtures have asymmetrical light distribution. They are for lighting sloping and vertical surfaces and for show window and cove applications.

Reflectorless Fixtures have aluminum-bronze finish channel covers. They are suitable for certain strip lighting and decorative applications.

Construction

Channel is made of 20 gauge steel. Reflectors are Alzak aluminum, except items marked S, which are supplied with steel reflectors only — fluracite reflecting surface.

Decorative Type — For exposed-to-view mounting. Satin Silvertone finish, includes decorative end caps and reflector end plates.

Economy Type — For concealed installation and use where a fine finish is not so important. Rust-resisting plated finish, plain channel end caps (No. 46 extended end caps for making conduit connection), and open reflector ends.

Reflector end-plates finished in Satin Silvertone may be ordered separately for Economy Type Fixtures:

Cat. No.	Price Each	Type	Std. Pkg
502	\$1.80	Deep Symmetrical	10
503	1.45	Shallow Symmetrical	10
504	2.00	Asymmetrical (right end)	10
505	2.00	Asymmetrical (left end)	10

How to Order Continuous Runs

Extension units (see tables on next page) for Fluorescent CurtiStrip permit making up continuous runs with any number of lamps. Basic units come in lengths up to nine feet. When a section more than nine feet long is desired, the run is made up with one Basic unit and one or more Extension units. The required Extension units should be selected first and the Basic unit used to complete the run.

DAWN "DESIGN 12" LUMINAIRE

This luminaire is unexcelled in design and appearance. The glass side panels and the aluminum louver with patented aluminite finish shield the lamps and reduce the brightness of the unit to comfortable levels, making it an excellent luminaire for high quality lighting of schools, offices and commercial areas where comfortable seeing conditions are a primary consideration.

Construction

Mechanical design for durability, ease of installation and ease of maintenance go with this luminaire. Metal parts are made of aluminum for light weight and durability. A separate ceiling pan with mounting bolts to attach the fixture proper is provided as a wiring trough for end to end mounting. The ballast pan of the fixture proper has socket straps apart from the cover so the cover may be removed for installation without disturbing the fixture wiring. The louver is suspended by a cradle support attached to mounting bolts which also hold the cover in place by means of two wing nuts.

Finish

The complete fixture has the patented aluminite finish. Aluminite is an electro-chemical process on aluminum which produces a hard, non-tarnishing, easy to clean surface, satin silver in appearance.

It is highly efficient in the reflection of light and the efficiency does not deteriorate with age.

Auxiliary Equipment

Luminaire is supplied wired complete with tulamp high power factor ballasts and no-blink starters.

†Cat. No. 44012 is available for 25 cycle operation at \$70.50 each. Instant start ballasts for 60 cycle 110-125 volts operation available, add \$16.00 to price. For additional rod hanger add \$1.00 list per foot or fraction thereof.

Lamps are not included in prices.

DAWN "DESIGN 16" LUMINAIRE

The two lamp companion luminaire to the outstanding four lamp Design 12. Similar in every respect, providing a more suitable unit for quality lighting in low ceiling areas. The glass side panels and the aluminum louver with patented alumilite finish shield the lamps and reduce the brightness of the unit to comfortable levels. Ideally suited for schools, offices and commercial areas with low ceilings where comfortable seeing conditions are of prime importance.

Construction

The metal parts, made of aluminum, are light in weight. A separate ceiling pan is provided as a wiring trough particularly suited for end to end mounting. This trough has knockouts and mounting holes punched for mounting to outlet boxes or ceiling. The ballast pan of the fixture has socket straps apart from the cover which permits the cover to be removed for installation without disturbing the fixture wiring. The cover is held by supporting bolts from the ballast pan secured by wing nuts. The louver is suspended in position and hinges from weld pins on the end caps.

Finish

The complete fixture has the patented alumilite finish. Alumilite is an electro-chemical process on aluminum which produces a hard, non-tarnishing, easy to clean surface, satin silver in appearance.

Auxiliary Equipment

Luminaire is supplied wired complete with tulamp high power factor ballasts and no-blink starters.

DAWN "DESIGN 21" LUMINAIRE

This is a direct-indirect type of luminaire with smart lines for modern offices, stores or commercial areas. The unit is neat and streamlined in appearance with fluted sides to shield the lamp and add distinction to a lighting system.

Construction

This luminaire is delicate in appearance but rigid in construction. A detachable U-shaped channel in the form of a ceiling assembly is the connecting link for attaching to the ceiling or outlet box. The main assembly is attached to this by means of two buttons on the top of the fixture wiring channel. The main assembly consists of a U-shaped wiring channel which supports the lampholders, starters, end caps and a special ballast housing with a separate chamber or junction box for making electrical connections to the circuit wiring. The wiring channel has a V-shaped cover held by side clips so is easily removed for wiring and servicing. The fluted side shields fit on to the end caps and are easily removable for cleaning and relamping.

Finish

Finish is standard painted white enamel.

Auxiliary Equipment

Luminaire is supplied wired complete with tulamp high power factor ballast and no-blink starters.

Installation

To install the fixture remove the U-shaped ceiling

assembly by turning the two buttons 90 degrees permitting it to slide off. This mounting support may be attached to an outlet box by means of hickey, nipple and locknuts or secured to the ceiling by means of wood screws and toggle bolts through holes provided in the channel. The circuit wiring is then threaded into this channel and the fixture proper slides into this assembly closing the U-shaped channel wireway and the unit is made secure by means of the turn buttons.

DAWN "DESIGN 10" LUMINAIRE

Design 10 is a modern unit with an adjustable reflector making it useful for many unusual applications. Mounted on the ceiling it makes an ideal indirect unit for halls and corridors. Mounted on the wall it makes a neat cove type unit by adjusting the reflector to direct all the light upwards or the reflector can be adjusted in the opposite way to direct the light down on specific areas. It has many other applications in private offices, corridors, bank cages, hallways, kitchens, bathrooms and as a bed reading lamp.

Construction

The unit is rigid in construction. The wiring pan is U-shaped with welded on end caps and socket straps separate from the cover.

Finish

The external surfaces are finished in metallic silver grey which blends in well with most color schemes. The interior of the reflector is finished white and the cover is aluminum with patented aluminite finish.

Auxiliary Equipment

The lighting unit is supplied wired complete with high power factor ballast, and no-blink starter.

Installation

To install the luminaire remove the reflector

by springing it off the end caps, then remove the separate cover by squeeze action. A center knockout is provided in the wiring pan for mounting to outlet boxes by means of hickey, nipple and locknuts. Mounting holes are also provided for securing by means of toggle bolts or wood screws and the circuit connection may be made in wire-mold through the wire-mold knockout in either end cap.

CANADIAN
GENERAL ELECTRIC

"FLUOROSTRIP" FIXTURES

Flat Channel Type

The compact size of the wiring channel permits the use of these fixtures in wall-cases and other locations where space is limited. They are available in individual units 18", 24", 36" and 48" in length, and may be joined in continuous runs with no spaces between sockets. Three reflector styles may be obtained: "A", flat channel type; "C", distributing type; "E", angle type.

Construction

The end cap is designed so that it may be removed and inserted again to form a connector strip, making a solid connection between fixtures. This eliminates the necessity of using connecting nipples and provides a full size wiring channel for wiring. A small BX connector box is available for application at the end of a run to make suitable connections. Fixtures are finished in baked white enamel. Supplied

wired, complete with starter and high power factor ballast. Available for 60 cycle 110-125 volt operation only.

FLUORESCENT SHOW CASE FIXTURES

View Showing Alternate Methods
of Installing Tubing

Mounting Clip

Cross Section of Reflector

Effective illumination of show cases plays an important part in modern methods of merchandising. A well-lighted show case not only improves the appearance of the store interior, but also attracts the attention of passing customers to the products displayed, resulting in increased sales.

This line of fluorescent show case fixtures is available in three packaged sizes, which provide sufficient flexibility to light most types of show cases.

Construction

The reflector is compact and modern in appearance, thus making it suitable for the new, clear-vision show cases. Two special mounting clips make it possible to install the fixture in wood trim, metal trim, or all-glass cases with equal facility.

Lamp and starter are readily accessible without removing fixture from the case. The ballast equipment is mounted in a separate box. Fixtures are

supplied wired, complete with ballast, starter, mounting clips, two 38" lengths of brass tubing, one 30" length of BX cable, ballast box, and the necessary connectors and clamps. Available for 60 cycle, 110-125 volt, high power factor operation only.

Finish

Reflecting surface is baked white enamel. Outside of fixture is available in brushed chrome or statuary bronze finish.

Cat. No.	Price Each	Description	Weight Each
5531	\$54.20	For 1-30 watt and 1-15 watt lamp	12
5532	31.90	For 1-15 watt lamp	16
5533	40.40	For 1-30 watt lamp	24

When ordering, specify whether brushed chrome or statuary bronze finish is required.
Lamps are not included in prices.

GENERAL ELECTRIC "DISINFECTAIRE" GERMICIDAL FIXTURE

Disinfectaire germicidal units provide controlled radiation of ultraviolet energy with maximum efficiency. Scientifically engineered and precision built, they reduce air-borne bacteria and other micro-organisms in the air.

An effective method for upper-air disinfection consists of installing Disinfectaire units on the side walls throughout the area to be irradiated.

The distribution of the reflector concentrates a controlled beam of high intensity radiation horizontally. This is accomplished through the use of an asymmetric reflector which has a curved surface compounded by a series of directional planes.

The distribution curve discloses the efficiency and effectiveness of the unit and indicates it can be advantageously used in low ceiling areas.

Disinfectaire units are attractively designed, with modelled end-plates and decorative chrome trim on a background finished in baked ivory enamel. The reflector is Alzak aluminum.

Units should be installed on the walls not less than 7 feet above the floor in a horizontal position —

Distribution Curve

radiation upward. Permanent type is supplied with $\frac{3}{8}$ " hickey, locknut and nipple for mounting on outlet box; or may be mounted directly on wall. Portable type is mounted by means of lugs on back plate, and is equipped with an 8 foot rubber cord and plug.

Disinfectaire units are supplied wired, complete with low power factor ballasts and FS-2 (15 watt) or FS-4 (30 watt) starters.

GERMICIDAL CURTISTRIP

Deep Reflector

Shallow Reflector

Directional Reflector

Reflectorless

Germicidal Curtistrip can be used for upward or downward radiation. They can be placed on top of book cases or filing cabinets or can be suspended from the ceiling. While they are strictly utilitarian, they are pleasing in appearance with clean functional lines.

DEEP REFLECTOR TYPE

For upward radiation, mount at least 4 feet above floor. For downward radiation, mount no higher than 6 feet above floor.

SHALLOW REFLECTOR TYPE

For upward radiation, mount at least 5 feet above floor. For downward radiation, mount no higher than 5 feet above floor.

DIRECTIONAL REFLECTOR TYPE

For upward radiation, mount at least 6 feet above floor. For downward radiation, mount no higher than 4 feet above floor.

REFLECTORLESS TYPE

For use only in air ducts or under hoods where the lamp is entirely concealed from the eyes.

Suspension

These units may be suspended from the ceiling by using two No. 614-G hangers, one at each end. Standard length 3 feet — longer lengths can be supplied at extra cost.

Cord and Plug

Catalogue numbers shown include the units wired and assembled complete with ballast but do not include cord or plug. If this is required, it can be furnished if specified on the order at extra cost.

Finish

Units are finished in aluminum and reflecting surface is aluminum. This reflecting surface is the highest efficiency type available.

GENERAL ELECTRIC "TWIN TURRET" LUMINAIRE

The General Electric Twin Turret industrial fluorescent luminaire provides cool, almost glare-free light for general and localized illumination of industrial areas. This economical and efficient fixture makes possible high levels of illumination for quick, accurate, easy seeing at a reasonable initial cost. Increased production efficiency, better working conditions, together with simplified installation and maintenance, are but a few of the benefits a properly designed installation of General Electric Twin Turret luminaires provides.

Design

The General Electric Twin Turret luminaire is carefully engineered to RLM Standards specifications. Light source is adequately shielded by reflector which has a 19 degree shielding angle from horizontal. Lamps are spaced on 3½ inch centres in accordance with RLM specifications.

Construction

Sturdily built to rigid General Electric standards to ensure long life and trouble free operation. Equipped with the new Twin Turret lampholder which permits easy lamp insertion and prevents

lamps from being dislodged. This lampholder, as well as being streamlined and neat in appearance, is exceptionally strongly constructed. Starters are conveniently located for easy maintenance.

Durable one-piece reflector uses quick-release cam-type fasteners. A quarter turn of the fastener instantly releases reflector from the housing, or fastens reflector securely in place. No tools are needed—installing and servicing are greatly speeded. When reflector is removed, ballast and wiring are exposed for ease of maintenance and installation.

Finish

Housings are finished in baked white enamel. Reflectors are available with high quality white porcelain enamel finish, inside and out, or baked white enamel. Reflection factor: porcelain enamel 79%; baked enamel 89%.

Auxiliary Equipment

Fixtures are supplied wired, complete with FS-40 Watch Dog starters and approved tulamp high power factor ballasts which reduce stroboscopic effects to a minimum.

GENERAL ELECTRIC "TWIN TURRET" LUMINAIRE

Conduit

Hanger Clamp

Junction Box Clamp

Surface Mounting

Chain

Bracket on Top

Angle

Continuous Wiring

Installation

Housing is provided with a shoulder for sliding hanger clamp which can be located at any point, thus making it unnecessary to position conduit exactly. Clamp is securely held by turning down one bolt, and is supplied with a hole for $\frac{1}{2}$ inch conduit. If desired, clamp may be mounted directly on ceiling. Junction box clamp, supplied with enclosing side plates, is available for use with conduit containing wiring. Top of housing has six knockouts for $\frac{1}{2}$ inch conduit located in pairs on 22, 30 and 38 inch centres. Side brackets are supplied for chain or wire suspension. These brackets can be

removed and located on top of housing for chain or direct ceiling mounting. Easily accessible starter permits recessing.

Continuous Wiring

To mount in continuous rows, remove end plates by undoing three screws, and bolt fixtures together through eyelets in side brackets. Wiring is simplified by the large wire opening, which has the same cross-section as the housing. As an alternative, end plates may be left on fixture and knockouts only removed. Conduit can be connected between fixtures, through holes in end plates, to provide continuous wiring with any spacing of fixtures.

DETAILS OF CONSTRUCTION

Easily removed knockout provides hole for half-inch conduit.

Twin turret lampholder simplifies installation and maintenance.

Watch Dog starters readily accessible without removing lamps.

Reflector quickly detached from housing (by cam-type fasteners) without disturbing wiring.

Six knockouts on top of housing.

Eyelets for chain or wire suspension.

Side brackets can be removed and mounted on top.

Edge of reflector double-folded for greater strength.

CONTINUOUS MOUNTING

Fixtures bolted together through eyelets for continuous mounting

GENERAL ELECTRIC "TWIN TURRET" CHANNEL LUMINAIRE

Suitable for use where wide distribution of light is required, with low mounting heights. Its narrowness makes it ideal for locations where space does not permit the use of regular RLM reflectors.

Similar in construction to the RLM Twin Turret luminaire, except that it is supplied with a flat reflector in place of the RLM reflector. Uses two 40 watt lamps.

Finished in white baked enamel. Overall dimensions: length $49\frac{3}{16}$ ", width $5\frac{1}{2}$ ", depth $4\frac{7}{8}$ ". Equipped with FS-40 Watch Dog starters and tulamp high power factor ballasts.

Lamps are not included in prices.

LOUVER FOR "TWIN TURRET" LUMINAIRE

This louver is for use in industrial plants where additional lamp shielding is often found desirable for greater eye comfort in areas such as drafting rooms, offices, etc. The addition of this louver increases the shielding angle of General Electric Twin Turret luminaires to 45° crosswise and 30° parallel to the lamps.

Louver can be quickly and easily attached to luminaire without the necessity of drilling reflector.

By merely pressing two spring clips, the louver can be opened instantly and hinged downward for convenience in relamping and cleaning. Rigidly constructed of heavy gauge metal, finished in baked white enamel.

GENERAL ELECTRIC 2-40 AND 3-40 WATT INDUSTRIAL LUMINAIRES

General Electric 2-40 and 3-40 watt industrial fluorescent luminaires provide cool, almost glare-free light for general and localized illumination of industrial areas. Increased production efficiency, better working conditions, together with simplified installation and maintenance, are but a few of the benefits a skilfully designed installation of these efficient luminaires provides.

Design

Carefully engineered to RLM specifications. Light source is adequately shielded by reflector which has a 13 degree shielding angle from horizontal. Lamps in the 2-40 watt fixture are spaced on 5 inch centres in accordance with RLM specifications.

Construction

Sturdily built to rigid General Electric standards to ensure long life and trouble free operation. Die-formed platforms of 18 gauge steel and cast aluminum end plates ensure rigid, accurate mounting of sockets.

Durable one-piece reflector uses quick-release cam type fasteners. A quarter turn of the fastener instantly releases reflector from the housing, or fastens reflector securely in place. No tools are needed — installing and servicing are greatly speeded. When reflector is removed, ballast and wiring are exposed for ease of maintenance and installation.

To eliminate chipping of enamel, lampholder openings in reflector are carefully designed with rounded corners, free from narrow brittle sections.

GENERAL ELECTRIC 2-85 WATT INDUSTRIAL LUMINAIRE

The General Electric 2-85 watt industrial fluorescent fixture provides cool, almost glare-free light for general illumination of industrial areas. It is particularly suited for high bay mounting, or for wider spacing of units or rows. This economical and efficient fixture makes possible high levels of illumination for quick, accurate, easy seeing at a reasonable initial cost.

Increased production efficiency, better working conditions, together with simplified installation and maintenance, are but a few of the benefits a skillfully designed installation of General Electric fluorescent fixtures provides.

Design

Carefully engineered to RLM Standards specifications. Light source is adequately shielded by reflector which has a 13 degree shielding angle from horizontal.

Construction

Sturdily built to rigid General Electric standards to ensure long life and trouble free operation. All auxiliary equipment is mounted in the housing for ease of installation and maintenance. Cast aluminum end plates with extensions ensure rigid, accurate mounting of sockets. Durable one-piece reflector is easily detached from housing by three wing nuts which provide positive, anti-vibration locking of reflector.

Finish

Reflector and housing are finished inside and out, in baked white synthetic enamel.

Installation

May be mounted flush or suspended. Top of housing has two knockouts for $\frac{1}{2}$ inch conduit, on 30 inch centres. For chain or wire suspension there are eyelets in the end castings. Fixture may be

*Foot-candles are calculated average in-service values, using a maintenance factor of .70 which allows 30% for depreciation due to dust collection and ageing of lamps. Figures are based on the use of 4500°K White lamps. For 6500°K Daylight lamps, multiply values by .97. For 3500°K White lamps, multiply values by 1.05.

†Light—Ceiling, 75% or better reflection factor; walls, 50%.
Medium—Ceiling, 50% reflection factor; walls, 30%.
Dark—Ceiling, 30% reflection factor; walls, 10%.

‡Wide—Room width is 4 times mounting height of units above floor.
Medium—Room width is 2 times mounting height of units above floor.
Narrow—Room width is about equal to mounting height of units above floor.

GENERAL ELECTRIC 1-40 WATT INDUSTRIAL LUMINAIRE

Ideal for local lighting of machines, work-benches, etc. Reflector is designed to provide adequate shielding of light source.

Strongly built of heavy gauge metal, finished inside and out in baked white enamel. End plate extensions provide protection for sockets and ensure proper spacing. Reflector fastens to channel by means of two screws. Knockouts in end plates are provided for continuous mounting.

Available for 60 cycle, 110-125 volt operation only, high or low power factor. Supplied wired,

complete with ballast and FS-40 Watch Dog starter. Overall dimensions: length $48\frac{1}{8}$ ", width $8\frac{7}{8}$ ", depth $8\frac{5}{8}$ ".

4601	\$16.00	1-40	90	12
4602	11.50	1-40	60	11

Lamps are not included in prices.

GENERAL ELECTRIC CHANNEL FIXTURE

This channel fixture will find many applications in stores and homes. Small in size and neat in appearance, it is suitable for store showcases, kitchens and playrooms, and for cove lighting installations.

Strongly constructed of heavy gauge metal, finished inside and out in baked white enamel. End plate extensions provide protection for sockets and ensure proper spacing. Reflector is fastened to channel by means of two easily-removed screws. Knockouts in end plates are provided for continuous mounting.

Available for 60 cycle, 110-125 volt operation only, high or low power factor. Supplied wired,

complete with ballast and starter (FS-40 Watch Dog in 40 Watt Fixtures; FS-2 in 20 Watt Fixtures.) Overall dimensions: length—20 watt, $24\frac{1}{8}$ "; 40 watt, $48\frac{1}{8}$ "; width $3\frac{7}{16}$ ", depth, channel only, $2\frac{5}{8}$ "; including lampholder, $4\frac{1}{4}$ ".

*Consists of two No. 4605 wired with one tulamp ballast. For end-to-end mounting.

Lamps are not included in prices.

GENERAL ELECTRIC INDUSTRIAL LUMINAIRE

USING SLIMLINE LAMPS

This General Electric luminaire provides high intensities of illumination for rapid, easy seeing at reasonable initial cost. Easy to install and efficient in operation, this luminaire is ideal for general illumination of industrial areas.

Luminaire accommodates two 96" Slimline lamps, and may be obtained for 200 or 300 milliamperere operation. No starters are required, thus making possible instant starting of lamps. Reflector provides 16° shielding of lamps.

Construction

Sturdily built to ensure long, trouble-free life. One-piece reflector uses three quick-release cam-type fasteners, which require only a quarter turn to remove reflector from housing. When reflector is removed, ballast and wiring are exposed for ease of maintenance and installation. Lamp holders permit easy lamp insertion and prevent lamps from being dislodged.

Luminaire is finished inside and out in baked white enamel. Supplied wired, complete with approved high power factor tulamp ballast.

Cross Section

Plan of Housing

Installation

May be mounted flush or suspended. For pipe suspension, top of housing has four knockouts for 1/2" conduit. For chain or wire suspension there are eyelets in the end castings. To mount in continuous rows, remove knockouts from end castings and bolt fixtures together through eyelets.

FIXTURE SUSPENSIONS

"HYDEE" HANGER

The "Hydee" hanger can be used with all industrial fluorescent fixtures arranged for chain suspension and furnished with two-wire cord and plug. Installation is simplified and speeded with this hanger.

Two screws hold the "Hydee" hanger to all standard $3\frac{1}{4}$ or 4 inch outlet boxes or plaster rings. Furnished complete including receptacle for two-prong plug, two 5 ft. chains, "S" hooks and cord clips.

CLIP-ON LOUVER

This louver provides excellent longitudinal shielding, as well as improving the appearance of all exposed lamp fixtures. Easily attached by spring clips; no bolts, screws or tools required. Made of aluminum, finished in baked white enamel.

Can be used with industrial and exposed lamp commercial fixtures. Where the end plate con-

struction does not permit easy attachment of the standard length louver, it can readily be shortened by cutting off one or two fins.

WHEELER DUREX REFLECTORS

RLM Standard Dome

Shallow Dome

RLM Deep Bowl

RLM 30° Angle

Durex reflectors represent the latest development in industrial incandescent lighting equipment. The threaded neck of the reflector screws into the die-cast canopy, providing a secure grip without the necessity of set screws. No washers, locknuts or yokes are required.

Socket is firmly attached to canopy by two screws which fit into bayonet holes in the socket. Porcelain socket shell screws on and off easily, exposing contact screws for ready wiring. Reflectors are porcelain enamelled steel, green outside, white inside. Canopies are finished in natural aluminum.

Both Durex canopies are interchangeable with any of the Durex reflectors. Durex fixtures can be ordered in separate units of canopies and reflectors, or in combination assemblies.

WHEELER DURATACH REFLECTORS

RLM Standard Dome

Shallow Dome

RLM Deep Bowl

RLM 30° Angle

The Duratach separable socket construction allows unit removal of lamp and reflector for cleaning, re-lamping or interchanging of fixtures without disturbing wiring connections.

The porcelain socket cap accommodates all medium and mogul base Duratach reflectors, thus permitting extreme flexibility of lighting equipment. Socket cap is attached to die-cast canopy by two screws which fit into bayonet holes in the cap. Reflectors are porcelain enamelled steel, green outside, white inside. Canopies are finished in natural aluminum. Reflector with lamp and socket body all in place is screwed into canopy as a complete unit.

WHEELER SHADEHOLDER REFLECTORS

For "Snap-Tite" Holders or any Standard 2 1/4 inch Shadeholder

RLM Standard Dome

Shallow Dome

RLM Deep Bowl

RLM 30° Angle

Wheeler shadeholder reflectors are available in four styles: RLM standard dome, shallow dome, RLM deep bowl, and RLM 30° angle. They are designed for use with "Snap-Tite" holders or any standard 2 1/4 inch shadeholder. Reflectors are porcelain enamelled steel, green outside, white inside.

"Snap-Tite" Holders

These holders are simple to attach and effective in results. When used with the proper socket, correct lamp position in the reflector is obtained.

To attach either of the styles of "Snap-Tite" holders to a reflector, keep the rivet heads in collar of holder in alignment with slots in reflector neck and press down on the holder until its bronze spring lugs snap into position in the reflector. When this occurs, the holder is rigidly attached to the reflector and ready for connecting to the socket.

WHEELER ONE-PIECE SOLID NECK REFLECTORS

RLM Standard Dome

Shallow Dome

RLM Deep Bowl

RLM 30° Angle

Application

These reflectors are recommended for both indoor and outdoor use in locations where quick removal or interchangeability of reflectors is not important or necessary.

Construction

The neck construction of these reflectors provides a rugged one piece fixture. The two piece porcelain socket is fastened to a die-cast yoke with a deep hexagonal shoulder, which fits an opening in the top of the reflector neck and is securely clamped by a die-cast locknut. Reflectors are porcelain enameled steel, green outside, white inside.

Installation

To mount reflector to conduit, remove locknut, dropping yoke and socket out of reflector. Remove socket body from yoke, leaving socket cap in place. Slide locknut, washer and reflector over conduit in that order. Screw yoke, with socket cap attached, to conduit. Make wiring connections to socket terminals and replace socket body. Lower reflector, washer and locknut. Engage yoke and locknut, threads of which are right hand, permitting complete fixture to be tightened.

Yokes are tapped $\frac{1}{2}$ " standard, $\frac{3}{4}$ " when specified at no increase in price.

WHEELER REFLECTORS

For 400-Watt Mercury Vapour Lamp

Reflectors are porcelain enamelled steel, green outside, white inside. Threaded neck of reflector engages with pendent or outlet box canopy. Open type mogul socket for ventilating lamp base. Unit is vented by means of five spacer assemblies which set up a clearance between reflector and neck.

Low Bay Type

This fixture provides a wide distribution of light for general illumination. An opal glass diffusing band suspended around the lower portion of the lamp reduces glare at normal viewing angles.

High Bay Type

This fixture gives a concentrated distribution of light. By directing the light downward to the work area there is less waste of light on ceilings and side walls under high mounting conditions.

WHEELER ALZAK ALUMINUM REFLECTORS

Concentrating Type Reflector

Distributing Type Reflector

Wheeler Alzak aluminum deep bowl reflectors consist of a cast canopy, socket, and aluminum reflector with diffused Alzak aluminum reflecting surface. The Alzak finish provides effective light control and maintains its original efficiency under normal operating conditions.

These reflectors are supplied with Duratach cast canopies in pendent or outlet box types. The Duratach canopy permits unit removal of lamp and reflector for cleaning and re-lamping.

Reflectors are finished natural aluminum outside. Canopies finished in natural aluminum.

Pendent canopies tapped $\frac{1}{2}$ " standard; $\frac{3}{4}$ " when specified at no extra charge. Outlet box canopies are for 4" outlet boxes.

Concentrating Type

Concentrating type Alzak aluminum reflectors are recommended for locations where mounting heights are 30 feet and over, and all available light must be concentrated in a comparatively small area directly below the unit. Suitable for lighting high narrow bays in foundries, craneways, steel mills, airplane hangars, locomotive shops and similar locations.

Distributing Type

Distributing type Alzak aluminum reflectors are designed to provide a general distribution of light over a broad area. Light distribution is uniform and more intense than could be obtained with porcelain enamelled reflectors. These units are suitable for locations where mounting heights range from 15 to 25 feet.

48	24	75	100	150
54	27	100	150	...
60	30	100	150	...

Dimension "L" is length of conduit from sign to reflector. "H" is overall height of sign.

MOUNTING DATA

The distance between reflectors on rectangular signs requiring the use of more than one unit per side should not be more than twice dimension "L".

These fixtures consist of a steel reflector, porcelain enamelled green outside, white inside; a separable cast canopy finished in baked green enamel; and a two-piece removable ring type of socket. Two canopy styles are available: side outlet and top outlet. The top outlet canopy allows for pendent suspension. Reflector neck slips into either canopy and is held firmly in place by a clamping screw on the outside of the canopy. Reflector may be assembled to side outlet canopy in normal or in reversed position.

REFLECTORS

No. 2491-2493 are 30-degree angle reflectors. Small and inconspicuous during the day, they do not obstruct the view of the sign's message.

No. 2691-2693 are elliptical in shape and intended for small oval and round signs. The elliptical

mouth opening allows a slightly wider spread of light laterally than is obtainable from a symmetrical angle reflector of comparable size. Also, the upward cut-off of the reflector more nearly approaches a straight line, thus helping to eliminate any scalloping effect.

No. 2695-2696 rectangular reflectors are designed for small rectangular, square, or oval shaped bulletin boards.

WHEELER TWO-PIECE ISOLUX SIGN REFLECTORS

MEDIUM BASE

Top Outlet Canopy

With Side Outlet Canopy

MOGUL BASE

Top Outlet Canopy

With Side Outlet Canopy

Medium Base Reflectors

Medium base Isolux sign reflectors incorporate a separable cast canopy, finished in baked green enamel. Reflector attaches directly to canopy and is securely held in position by a clamping screw on the outside of the canopy. Reflector may be assembled to canopy either in normal or in reversed position. In reversed position, fixtures can be used for lighting alleys, paths, etc.

Reflectors are porcelain enamelled steel, green outside, white inside. Other colors are available, prices on request.

*Side outlet canopy is tapped $\frac{1}{8}$ " standard, $\frac{3}{4}$ " when specified at no increase in price. Top outlet canopy is tapped $\frac{1}{2}$ " only.

Mogul Base Reflectors

Mogul base Isolux sign reflectors consist of a porcelain enamelled reflector and a galvanized cast canopy furnished complete with socket.

The feature of this reflector construction is the hinged, split clamp canopy which swings open when fastening screw is loosened. A convex shaped ridge which extends around the inside of the canopy fits into a groove in the neck of the reflector, assuring a tight and positive method of clamp attachment. Reflectors may be assembled to canopy either in normal or in reversed position.

Cat. No. 2454 is finished porcelain enamelled white outside and inside as standard; Cat. No. 2458 is green outside. Other colors are available, prices on request.

Two canopy styles are available: side outlet and top outlet. Both are tapped 1". Side outlet canopy leads straight into conduit, no bends or elbows are necessary.

Complete information on wire guards is given on page 106.

WHEELER ONE-PIECE ISOLUX SIGN REFLECTORS

One-piece Isolux Sign Reflectors are highly efficient units recommended for side lighting in locations where overhead lighting cannot satisfactorily be employed. These include factories, yards, platforms, skating rinks, bowling alleys, etc.

Fixtures consist of a porcelain enamelled reflector, a rugged

porcelain socket having large contact screws for easy wiring, and a yoke and nut tapped $\frac{1}{2}$ " standard; $\frac{3}{4}$ " when specified, at no advance in price.

Medium Base Isolux Reflectors are supplied with standard two-piece medium base sockets. Mogul Base Isolux Reflectors are supplied with one-piece side wired mogul base sockets.

Reflectors are finished porcelain enamelled green outside, white inside, except Cat. No. 2377 (300-500 watts), which is finished white outside. Other colors are available, prices on request. Supplied for pendant suspension only. Tapped $\frac{1}{2}$ " standard; $\frac{3}{4}$ " when specified, at no increase in price.

Wire Guards: Complete information on wire guards is given on page 106.

WHEELER ISLAND LIGHTS AND COMBINATION UNITS

For lighting gasoline pump islands, taxi cab stands, shipping platforms, railroad platforms, safety islands, docks, yards, driveways and courts, service stations.

ISLAND LIGHT

Reflector is made of steel, porcelain enamelled green or red outside, white inside. The cast hub slips over 2-inch pipe and is held securely in place by means of two large set screws. Three aluminum rods support the reflector. Lamp size 300-500 watts.

COMBINATION UNIT

Consists of Island Light and 300-500 watt enclosed floodlight mounted on top, thus making possible simultaneous floodlighting of buildings and lighting of pump islands. Floodlight has highly efficient and durable reflector of Alzak aluminum. Exterior is finished in natural aluminum. If desired, floodlight can readily be added to Island Light at any future date.

WHEELER REFLECTOR FOR BLACKBOARD LIGHTING

When used with the PAR-38 projector floodlamp, this reflector provides an efficient and economical way of lighting classroom blackboards. A suggest-

ed method of installation is the use of type JA-1 condulets, having a fixed angle of 27 degrees, and No. CC2270 receptacles. Condulets should be spaced 4 feet apart, and mounted on the ceiling so that the distance from centre of condulet to wall is $\frac{3}{4}$ the distance from ceiling to middle of blackboard.

This reflector also may be used for local lighting over work-benches, machines and desks. It will accommodate 40 or 60 watt inside-frosted lamps.

Finished inside and out in aluminite, which will not tarnish or deteriorate in normal service. Supplied with a Snap-Tite holder for porcelain sockets. The holder attaches very easily and quickly, snapping under the heel of the reflector and fastening reflector and socket securely together.

WHEELER DUST-TIGHT GLASS COVERS

Wheeler dust-tight covers provide an inexpensive yet effective method of protecting the lamps, sockets and inner reflecting surfaces of reflectors. In industrial locations where there is an excessive amount of dirt present, or in outside locations where it is essential to protect the lamp from the weather, maintenance costs can be reduced to a minimum by using Wheeler dust-tight covers.

These covers can be attached quickly and easily to RLM dome, deep bowl, angle, or aluminum reflectors by slipping the retaining ring over the

head of the reflector, and closing the positive spring clamp. An asbestos gasket seals the assembly. The rolled channel retaining ring is made of aluminum. Convex glass plates are supplied in clear glass as standard; sand-blast etched glass is available.

WHEELER VAPOUR-PROOF FIXTURES

PENDENT TYPES

CEILING TYPES

Application

These fixtures are recommended for use in locations where moisture or non-combustible dusts or vapours are present.

Construction

The two piece cast aluminum canopy is threaded to take the heavy glass globe. Both pendent and ceiling type canopy tops are interchangeable on all canopy bodies. A gasket between the globe and canopy body and one between the canopy body and canopy top ensure a tight unit. A stuffing gland seals lead-in wires. Reflectors are interchangeable throughout the medium base and mogul base range. Globes are available in clear, opal or heat-resisting clear glass.

Finish

The reflector is finished in acid resisting porcelain enamel, green outside, white inside. The canopy is finished natural aluminum.

Installation

By removing the top from the canopy body, the socket is fully exposed so that wiring to socket terminals is easily done.

Wire Guards

Guards are available for vapour-proof fixtures without reflector. See page 106.

Pendent Canopies

Supplied with canopy top tapped for $\frac{1}{2}$ " conduit. When specified on order, top will be tapped for $\frac{3}{4}$ " conduit without additional charge.

Ceiling Canopies

Supplied with canopy top drilled for standard 4" outlet boxes. When specified, top will be drilled with four holes for attaching to a cast heavy duty water-tight junction box, without additional charge.

WHEELER "VAPOLUX" FIXTURES

Dust-tight and Vapour-proof

Listed by Underwriters' Laboratories for Class II, Group G Hazardous Locations

Standard Dome

Sectional View of Vapolux Fixture

30° Angle

Wheeler "Vapolux" fixtures are recommended for Class II Group G hazardous locations where combustible dust atmospheres exist, such as in flour mills, feed mills, grain elevators, starch mills, sugar, cocoa and coal pulverizing plants, and establishments or industries involving similar hazardous processes or conditions.

Construction

The porcelain enamelled steel reflector is entirely enclosed and protected by a rugged, clear, heat resisting cover glass permanently sealed in place. This construction prevents the accumulation of smoke, dust, moisture or dirt on the reflecting surface. Thus, to restore the unit to initial efficiency, it is simply a matter of cleaning the outside surface of the cover glass.

The cast aluminum canopy is of two-piece construction, the joint between the canopy top and canopy body being made by closely fitting machined threads. This avoids the necessity of any gasket between these two parts which are infrequently separated. An aluminum baffle plate is secured in the lower end of the canopy body to provide additional reflecting surface.

Canopies are tapped $\frac{1}{2}$ " standard; $\frac{3}{4}$ " when specified at no increase in price. Available for pendent suspension only.

Finish

The reflector is finished in acid resisting porcelain enamel, green outside, white inside. Canopy is finished natural aluminum.

Installation

Wiring is particularly simple due to the easily accessible porcelain socket mounted in the removable canopy top. Set screws are provided at all threaded joints as well as in the conduit hub, for positive protection against loosening under constant vibration.

Relamping

Relamping is accomplished by unscrewing the reflector and sealed-in cover glass as a unit from the canopy and lowering it down over the lamp. A mechanically attached gasket is provided at this threaded joint to ensure a tight seal when the reflector is replaced.

WHEELER "CLASS II-G" GLOBE TYPE FIXTURES

Dust-tight and Vapour-proof

Listed by Underwriters' Laboratories for Class II, Group G Hazardous Locations

Standard Dome

Sectional View of "Class II-G" Globe Type Fixture

Wheeler "Class II-G" Globe type fixtures are recommended for Class II Group G hazardous locations where combustible dust atmospheres exist, such as flour mills, feed mills, grain elevators, starch mills, sugar, cocoa and coal pulverizing plants, and establishments or industries involving similar hazardous processes or conditions.

Construction

The lamp is totally enclosed in a dust-exclusion chamber formed at its upper end by the cast canopy parts and at the lower end by the threaded glass globe. The seal between the globe and canopy body is entirely independent of the threaded reflector neck, so that effective protection is afforded even though the reflector might not be thoroughly seated in the canopy body.

The cast aluminum canopy is of two-piece construction, the joint between the canopy top and canopy body being made by closely fitting machined threads. This avoids the necessity of any gasket between these two parts which are infrequently separated. An aluminum baffle plate is secured in the lower end of the canopy body to provide additional reflecting surface.

Canopies are tapped $\frac{1}{2}$ " standard; $\frac{3}{4}$ " when specified at no increase in price. Available for pendent suspension only.

Finish

The steel reflector is finished in acid resisting porcelain enamel, green outside, white inside. Canopy is finished natural aluminum.

Installation

Wiring is particularly simple due to the easily accessible porcelain socket mounted in the removable canopy top. Set screws are provided at all threaded joints as well as in the conduit hub, for positive protection against loosening under constant vibration.

Relamping

Relamping is accomplished by merely removing threaded glass globe, or if reflector cleaning is necessary at the same time—reflector and globe may be taken down as a unit over the lamp. If the latter procedure is followed, the globe should be left loose in the reflector neck, when relamping, so that it can be driven home against its seating gasket after the reflector has been seated to the canopy body. The globe seating gasket is mechanically attached in the canopy body, so there is no chance of reassembling the fixture with the gasket being omitted.

Listed by Underwriters' Laboratories for Class 1, Group D Hazardous Locations

Standard Dome

Shallow Dome

Deep Bowl

30° Angle

Without Reflector

Ceiling Type

Wall Bracket Fixture

Side Wall Fixture

Gasoline Pump Unit

Wheeler explosion-proof fixtures are designed for Class I Group D hazardous locations—atmospheres containing vapours of gasoline, petroleum, naphtha, alcohols, acetone, lacquer solvents and natural gas.

Construction

Sturdily built with strong cast walls and furnished with a special heat resisting lens of sufficient thickness to withstand the shattering pressures of internal explosion, they prevent sparks or hot gases from escaping and igniting vaporous or gaseous atmosphere.

Finish

The steel reflector is finished in porcelain enamel, green outside, white inside. Cadmium finish on canopy; aluminum on guard, hood and screw cover.

Installation

Wiring the fixture is easily and quickly accomplished. Lamp and wiring chambers are securely separated by a wall of sealing cement so that should an explosion occur in one chamber it cannot harm the other.

Relamping

Relamping is easily done by loosening the two thumb screws on either side of the fixture and unscrewing the entire hood unit, consisting of hood, reflector, lens and guard, from the dome.

PENDENT FIXTURES

Tapped $\frac{3}{4}$ " standard.*

CEILING FIXTURES

To order Ceiling type fixtures simply add the suffix CT to the catalogue number of the corresponding Pendant type listing. The addition for ceiling type fixtures is \$6.34. Explosion-proof

*Available tapped for $\frac{1}{2}$ " conduit at a reduction of \$0.42.

outlet box has four threaded hubs for $\frac{3}{4}$ -inch conduit*, three of which have close-up plugs.

WALL BRACKET FIXTURE

An explosion-proof fixture with a wall bracket outlet box type of canopy construction which permits fixture to be suspended at a greater distance from the wall than is possible with the "Side Wall" style of fixture.

The explosion-proof outlet box on the bracket has four threaded holes for $\frac{3}{4}$ " conduit*, three of which have close-up plugs.

SIDE WALL FIXTURE

An explosion-proof fixture with canopy constructed for direct attachment to sidewalls.

Cadmium finish on canopy. Aluminum on guard, hood, and screw cover. Tapped $\frac{3}{4}$ " standard*.

GASOLINE PUMP UNIT

A compact and reliable explosion-proof lighting fixture for illumination of gasoline pumps and pump dials.

Furnished with a small oscillating switch which is wired in the controlling circuit. A screw cover in the back of the fixture permits wiring connections to be quickly and easily made. Lamp and wiring chambers are securely separated by a wall of sealing cement so that should an explosion occur in one chamber, it cannot harm the other.

Fixture may be used for direct or indirect lighting and may be mounted in any position. Inasmuch as fixture is usually installed inside pumps, no guard is furnished. To relamp, simply remove entire globe unit.

Cadmium finish on canopy. Aluminum on threaded ring and screw cover. Tapped $\frac{1}{2}$ " standard.

WHEELER WIRE GUARDS

Guard for Round Reflectors

Guard for Isolux Reflectors

No. 170 Guard

Wheeler wire guards are ruggedly constructed of heavy wire which is tinned after spot welding. A unique clamping screw arrangement permits rapid removal of these guards for cleaning and relamping reflectors.

Throughout most of the catalogue, reflector diameters have been indicated in the nearest even inch dimension. However, in some instances exact overall bead diameters have been given. Guards have been made to clamp properly around reflector bead diameter as shown in the "Actual" column.

WHEELER GLOBE HOLDER AND SHADE

GLOBE HOLDER

Weatherproof

Made of steel, porcelain enamelled white inside and green outside. Supplied complete with medium base socket, supporting yoke and locknut. Yoke is tapped 1/2-inch standard; 3/4-inch when specified, at no extra charge.

Cat. No.	Price Each	Fitter	Std Pkg	
			Qty	Wt
231	\$3.75	6"	10	30

SHADE

Painted Half Shade

For 40, 50 and 60-watt lamps. Length 5 1/8 inches; depth 2 1/8 inches. With collar to fit standard holders. Baked enamel inside and out. Green outside and white inside.

Cat. No.	Price Each	Std Pkg	
		Qty	Wt
375	\$0.60	25	10

WHEELER SOCKETS

MEDIUM BASE SOCKET

Used on Durex medium base reflectors. A removable ring type of socket with supporting screw holes on $1\frac{15}{32}$ " centres. Porcelain socket shell can be screwed off to expose contact screws for ready wiring.

Cat. No.	Price Each	Description	Std Pkg	
			Qty	Wt
222	\$0.84	Socket only	10	8

STANDARD TWO PIECE SOCKETS

Used on Durex mogul base reflectors, medium base One-piece Solid-neck reflectors, medium base One-piece Isolux reflectors, and mogul Vapour-proof fixtures.

A two-piece porcelain socket of rugged construction. Socket cap has slotted holes on $1\frac{15}{32}$ " centres for supporting screws. By removing socket body, terminal screws are exposed on the lower side of the cap.

Cat. No.	Price Each	Base	Description	Std Pkg

DURATACH SOCKETS

Medium and Mogul Base

The Duratach porcelain socket cap accommodates all medium and mogul base Duratach reflectors. Socket cap is attached to canopy by two screws which fit into bayonet holes in the socket cap.

The socket bodies are rigidly held in the reflector necks by means of two screws. Shock-absorbing features may be added at any time merely by insertion of a shock-absorbing element.

WHEELER FITTINGS

BALL AND SOCKET ALIGNER

For 3 1/4 inch
and
4 inch Outlet
Boxes

The ball and socket construction permits the cover to be attached to an outlet box that is mounted at an angle, while the fixture itself hangs plumb. The die-cast ball is fitted to accommodate 1/2 inch pipe. The cadmium plated cover is made of steel and is attached to outlet box by means of two screws.

Cat. No.	Price Each	Description	Std Pkg	
			Qty	Wt
264	\$0.84	Aligner only	10	8

ALIGNER WITH SHOCK ABSORBER

For 3 1/4 inch
and
4 inch Outlet Boxes

This aligner assures the vertical hanging of reflectors and protects the fixtures from vibration. Will correct for any variation up to 15° from the vertical. Made of cast aluminum, tapped for 1/2 inch pipe.

Three sizes of springs are available, to accommodate various combined weights of fixtures and conduit. Springs are interchangeable.

Cat. No.	Price Each	Combined Weight of Fixture and Conduit	Std Pkg	
			Qty	Wt

HOLOPHANE IN-BILT FLUSH UNITS

No. F-1748 or No. F-1774

No. F-1748-2 or No. F-1774-2

Section No. F-1748

Distribution Curve
No. F-1748 150 WattsDistribution Curve
No. F-1774 200 Watts

Section No. F-1774

These units, being built-in, become an integral part of the building interior; they blend with most architectural designs. In most cases they are used in "general" lighting layouts; light is evenly spread over the room area when units are uniformly spaced on centers no greater than $1\frac{1}{4}$ times the mounting height. This type of lighting is used in stores, offices, banks, schools, churches, hospitals, studios, and public buildings.

Performance

The F-1748 and F-1774 series provide an intensive light distribution by means of an efficient optical train consisting of a specially designed Controlens

and square prismatic reflector. The Controlens† has the property of being able to accept rays of light approaching from equally opposite directions, at the same point on the lens, and diverge them an equally opposite amount. The diagram makes this clear.

Some light is emitted all the way up to the horizontal, but the quantity at the high angles (60° - 90°) is low, resulting in a comfortable appearance at normal angles of view. The appearance of the unit when installed in the ceiling is pleasing, both when lighted and unlighted. The emitted light is the same color as that of the lamp as crystal glass does not change the color of the light.

HOLOPHANE IN-BILT FLUSH UNITS

Section No. F-1739

No. F-1739 or No. F-1765

Section No. F-1765

Distribution Curve
No. F-1739 150 WattsDistribution Curve
No. F-1765 200 Watts

These In-Bilt units are used for three types of lighting:

General Lighting: in narrow high ceilinged interiors as may occur in some stores, churches, banks, gymnasiums, museums—where not more than two rows of outlets are used. For uniform illumination, these units should be installed on centers not exceeding 0.9 times the mounting height above the working plane.

Local Lighting: where the light is focused on people, objects, work areas, displays—as might occur with store counters, stage productions, inspection operations, laboratories, church pulpits.

General-Plus-Local-Lighting: where focusing beams are used to supplement existing installations by combination with the "general" system in use.

Performance

A variety of light patterns is possible varying from curve A through B, C and D as shown in the distribution curves on this page. Curve B, however, is the standard setting for units listed here. The change in light distribution results from changes in focus (distance of lamp filament from Controlens) and lamp offset (distance of lamp filament to right or left of centerline of Controlens). Some light is emitted all the way up to the horizontal but the quantity at the high angles (60°-90°) is low, resulting in a comfortable appearance at normal angles of view.

†Depth necessary for settings "A" and "C". Otherwise F-1765 is 10 1/8" deep.

Plaster rings are not furnished.

NOTE—Dimensions are approximate. Write for detailed sketch before making installation.

HOLOPHANE IN-BILT MODELITE

No. F-1778-M

The application of spot lighting to feature items of merchandise has become standard practice with display managers. Until the advent of the Modelite, this consisted of attaching spot lights to the ceilings or columns—a generally unsightly procedure.

The Modelite† is an In-Bilt Controlens lighting unit which makes it possible, for the first time, to spot light or "accent" merchandise display from a light source which is an integral part of the general lighting system. The result is unique in that the display is flooded with light without any distracting brightness of the source from which it comes.

Cross section sketch to show general light distribution from the two outside members and spot-lighting from central section.

HOLOPHANE IN-BILT COUNTERLITE

No. E-1814
Surface Mounted

No. F-1814
Recessed

The name Counterlite indicates the chief application of this precision lighting unit—the lighting of store counters. Centered over the customer's edge, it projects an oval pattern of light—narrow across and spread along the counter. In this way, the majority of the light is concentrated on the display, resulting in higher illumination and greater attraction. Spill light takes care of traffic aisles and stock shelves.

Construction

These units are available for either recessed or surface mounting. The optical parts—a compound Controlens and a polished aluminum reflector—are supported by a No. 16 gauge steel box. In the case of the surface type, the standard external finish is silver-tone aluminum which serves as a prime coat if the unit is to be painted in the ceiling.

Cat. No.	Price Each	Lamp Watts	Roughing Box (Inches)			Face Plate (In.)		Plaster Opening (In.)		Std Pkg

HOLOPHANE BLACKBOARD LIGHTING UNIT

No. E-796-2
Surface Mounted

Distribution Curve
No. F-796 100 Watts
A. Lateral Distribution
B. Vertical Distribution

Section No. F-796-2

No. F-796-2
Flush Mounted

These Controlens units are designed to light blackboards, bulletin boards, switchboard panels and similar vertical surfaces. The requirement for lighting a vertical surface is to bend the light beam toward the surface and then spread it out along the wall. The light should be directed to the surface at

a sharp angle so as to cut out specular reflection at normal viewing angles.

Generally, the 796 type is used as separate units in intermittent runs; also, for use with long blackboards. The 790 type is for use with continuous troughs or where a blackboard is isolated or narrow.

Cat. No.	Price Each	No. of Lens	Lamp Watts per Lens	Roughing Box (In.)			Face Plate (In.)		Plaster Opening (In.)		Std Pkg	
				Length	Width	Depth	Length	Width	Length	Width	Qty	Wt

NOTE re 790 type: Mechanical and dimensional details for E-790, E-790-2, F-790 and F-790-2 are identical with those for 796 Type. Prices on application.

HOLOPHANE IN-BILT SQUARE "NO-BOX" UNIT

No. R-2772 or R-2773

Distribution Curve
No. R-2772 200 Watts

These No-Box units are designed for installation without a metal housing, which results in considerable over-all economies. Efficient lighting perform-

ance between cleaning intervals is maintained because of the enclosed construction.

They are designed for tile or block ceilings and being 12" square will exactly replace a single tile. The R-2772 will fit any standard block construction, such as Celotex, and may be attached directly to the ceiling framing by means of a metal frame supplied with the unit. The R-2773 is especially designed for attachment to the "T" bar construction used with Johns-Manville Sanacoustic tile ceilings.

All these units have an intensive light distribution and are used mainly for general lighting. Spacings up to 1 1/4 times the mounting height above the work plane will deliver a uniform degree of illumination throughout the room.

HOLOPHANE IN-BILT ROUND "NO-BOX" UNITS

No. R-1894

No. R-2120, No. R-2130 or No. R-2140

No. R-5544

Distribution Curve
No. R-1894 200 Watts

Distribution Curve
No. R-2130 200 Watts

Distribution Curve
No. R-5544 300 Watts

R-1894: This flush unit, with round Controlens, is used for general lighting applications. It has been designed for installation without metal housing, which results in considerable over-all economies. Its round contour makes it suitable for certain architectural requirements. High lighting performance between cleaning intervals is assured because of the enclosed construction.

To maintain effective and uniform illumination, it should be installed on spacings not exceeding $1\frac{1}{4}$ times the mounting height above the working plane.

R-2120, R-2130 and R-2140: "In-Bilt" Reflector-Refractors combine beauty with efficiency. The design of the prismatic element harmonizes with all types of interiors and the control of the direct and reflected rays allows greater concentration of down light on working areas. Controlled light through the exposed portion affords pleasing ceiling illumination. Easy relamping is accomplished through the removable cup in the refractor member of the unit.

Units should be spaced on centers not exceeding 2 times the mounting height above the working plane.

R-5544 (In-Bilt Correctalite†): This unit combines excellent design characteristics with high lighting efficiency. It embodies semi-recessed design, with the light-controlling glassware projecting below the ceiling so as to provide some ceiling illumination. Easily relamped through a removable prismatic bottom plate.

For essentially uniform illumination install In-Bilt Correctalites on spacings not to exceed $1\frac{1}{4}$ times the mounting height above the working plane.

Installation

All units include a plaster ring which is first set into position before the ceiling is plastered. Flexible wiring from the outlet box is brought to the socket in the fitter. The fitter is attached to the neck of the unit and the assembly, resting on the finishing ring, is bolted into position to the ears of the plaster ring.

HOLOPHANE IN-BILT REFLECTOR-REFRACTOR

No. R-2460

Cross Section

Distribution Curve
No. R-2460, 150 wattsDistribution Curve No. R-2476, 150 watts
- - - - - Through 90° lateral plane—across aisle
— — — — — Through 0° lateral plane—along aisle
— — — — — Through 14° lateral plane
— — — — — Through 26 1/2° lateral planeDistribution Curve No. R-2472, 150 watts
- - - - - across aisle
— — — — — along aisle

In-Bilt reflector-refractor No. R-2460 is logically applicable where there is a low ceiling to be considered. Both its shallow lower refractor member and its very extensive light distribution are suited to this job condition. Extensive light distribution permits normal spacings for adequate coverage, despite low ceiling.

R-2460 In-Bilt units combine architectural beauty with lighting efficiency. The design of the prismatic element harmonizes with all types of interiors, and the control of the direct and reflected rays allows greater concentration of down-light on working areas. Controlled light through the exposed portion affords pleasing ceiling illumination. For essentially uniform illumination install R-2460 on spacings of two times the mounting height.

R-2460 and R-2470, having a symmetrical light distribution, are for general lighting. R-2472, asymmetric, is for corridor lighting. R-2476, asymmetric, is for stack lighting.

R-2460 is comprised of the 2460 reflector-refractor and fixture for semi-recessing it in the ceiling.

The reflector-refractor consists of an upper reflector part and a lower refractor part. The two parts are welded together. The top part reflects the upward light down. The lower part refracts the reflected light as well as the direct light from the lamp, into useful directions and at the same time diffuses it.

The fixture consists of a threaded fitter attached to an outlet box which is held by a steel strap connected with a cast iron plaster ring. A steel finishing ring, satin nickel finish, is attached to the plaster ring by means of four flush screws.

When the reflector-refractor is inserted in the threaded fitter, the flange comes up tightly against the finishing ring, making for a neat appearance.

Installation

Set plaster ring in position and finish ceiling. Connect flexible wiring from outlet box to socket in fitter. Attach finishing ring to plaster ring. Screw reflector-refractor in tight position against finishing ring. Asymmetric units have orienting fitters with screw adjustment to allow proper positioning to assure full realization of the special light patterns.

HOLOPHANE IN-BILT NIGHT LIGHT

No. W-792

Section No. W-792

This Controlens unit is designed for night lighting in hospital sickrooms, corridors, theatre aisles, bedrooms in homes, hotels, clubs, nurseries and similar locations. It throws an even sheet of low intensity

light over the lower part of the room or corridor without glare. The light cuts off abruptly at knee height. When concealed by placement in the wall beneath the bed, the floor is lighted uniformly, revealing the room for night inspection without waking the patient. Switches should be located outside the door. For corridor lighting, the height of the top of the unit may be determined by dividing the corridor width by 4.3.

The shallow depth of the unit (3") allows recessing in the thinnest standard structural partitions. This shallowness is accomplished through use of the slender T-6½, 25 watt tubular lamp. The prismatic Controlens is easily kept clean by dusting or washing with a damp cloth. The front face is readily removed to service the lamp.

HOLOPHANE IN-BILT PSYCHIATRIC LIGHTS

No. A-739 or No. A-765

Distribution Curve
No. A-765 200 Watts

The need for keeping "disturbed" patients under strict control and at the same time preventing them from harming themselves, dictates the mechanical features of the lighting system.

These special purpose Controlens units have the following characteristics which make them suitable for this critical application:

1. The unit is designed for flush installation in the ceiling—the hardest place for the patient to reach.
2. The unit is constructed as strong mechanically as possible.
3. The Controlens is Hi-Stress (high impact resisting) prismatic glass.
4. Unit can only be opened with special tool.
5. The unit is dirt-tight and requires a minimum of maintenance; it need only be opened to replace burned-out lamps.
6. The unit contains, in addition to the main lamp, an adjustable 10 watt auxiliary lamp that can always be located to throw the night light beam away from the bed so as not to awaken or disturb the patient.

HOLOPHANE MEDICAL EXAMINATION UNIT

No. CS-5000

Distribution No. CS-5000

The nature of the work performed by the physician in a medical examination room calls for two types of lighting:

1. High level of general illumination to light the entire room.

2. An intense beam directly on the examination table when he is checking the patient.

The Holophane medical examination unit is a double duty lighting device satisfying both requirements.

Construction

The prismatic glass globe is entirely smooth outside and can be readily wiped clean with a damp cloth; the fixture finish is smooth and washable as well. The lamp is directly accessible through a hinged bottom.

The fixture terminates in a $\frac{3}{8}$ " female hickey for direct attachment to outlet box. It should be installed directly over the examination area.

HOLOPHANE TWILITE SEMI-INDIRECT UNIT

No. S-7346

Distribution Curve
No. S-7346 150 Watts

This unit is for use specifically in nursing areas, wards, semi-private and private rooms. The physical predicament of the hospitalized patient is taken into account by the Holophane Twilite.* The five features that make the Twilite the logical first choice for this critical application are:

1. The semi-indirect light distribution gives the

room a soft, even illumination suitable for this purpose.

2. Since the unit is luminous, there are no "blind spots" to irritate the patient who may have to gaze at the ceiling for long unbroken periods.

3. At the same time the Twilite has a low enough surface brightness of its own so that it does not become a glare source.

4. Its dust and dirt depreciation is low for two reasons: (a) The light control surfaces are entirely enclosed, (b) Dust does not incline to settle on the steep sloped surface of the top of the Twilite.

5. The unit is designed so that it can be equipped with either a 150 or 200 watt standard lamp plus two small 7 watt candelabra base auxiliary lamps.

HOLOPHANE SURGICAL LIGHTING SYSTEM

Major Surgical Lighting System

In the field of surgery, precision lighting is of crucial importance. Holophane engineering has provided outstanding improvements in this specialized illumination. Consider the features that distinguish the new Holophane Surgical Lighting System from all others:

Efficient

Scientific grouping of enclosed multi-lens optics assures maintenance of intense illumination—without sacrifice of correct brightness throughout the entire field of view.

Safe

Location of lighting systems remote from anaesthetization zone eliminates hazards of explosion; multiple lamping avoids danger of interruption from lamp burnouts.

Aseptic

Permanently flushed into tight ceiling enclosures. No moving parts to dislodge dust.

Modern

Direction and pattern of light are pre-set; can be changed, without distracting surgeon, by remote wall switches.

Visual Comfort

Brightness contrasts throughout the operating room are extremely low. The lenses that could conceivably cross the surgeon's glance are only $1\frac{1}{2}$ times brighter than the minimum wound brightness; are less bright than the maximum wound brightness.

Thermal Comfort

No matter what the surgeon's position, lights that his body blocks can be switched off to reduce temperature rise on surgeon's back—important in lengthy operations. In addition, the use of heat-absorbing lenses accomplishes two purposes: reduces the direct infra-red transmission (heat waves) and corrects the light colour toward true white.

HOLOPHANE HOSPITAL OPERATING ROOM LIGHTING

No. D-729-L

No. D-729-T

Distribution Curve
No. D-729-L and
No. D-729-T

The Holophane Multiple Spot Lens System was originally designed for minor surgeries, delivery rooms, first aid rooms, emergency rooms, and fracture rooms. Since then, the practicability of the system from an operating stand point, its flexible adaptation to unusual structural conditions, and its low cost, have also made it popular for major surgery use.

Performance

The system provides a number of light beams converging to form a high intensity spot on the operating area, feathering into a larger area of less intense light over rest of table and at the same time spreading the correct degree of general illumination

over the entire room. It is without glare, interfering shadows or noticeable heat. Each system is separately designed for the particular purpose it is to serve, for the exact direction of light required and for the amount of illumination needed.

A complete Multiple Spot Lens System is composed of a number of individual lighting elements. Those that are level are designated as D-729-L; those which are tilted are known as D-729-T. Both types of elements are mounted directly on the ceiling. The greater number of individual elements there are, the larger will be the varieties of possible light patterns. Our Lighting Service Department will co-operate in preparing layouts to meet the specific requirements.

HOLOPHANE SEMI-DIRECT CORRECTALITE

Section

No. S-5540

No. C-5540

Distribution Curve
with 300 Watt Lamp

The Holophane Correctalite represents a new trend in semi-direct lighting. It is admirably suited for use in drafting rooms, offices, service areas, laboratories, public buildings, etc. The smooth, flowing lines of the fixture accentuate the attractive form of the prismatic light director which controls the reflected and direct light rays. There is greater concentration of down light on working areas, with adequate ceiling illumination.

Correctalite affords all the design and lighting advantages of Controlens lighting for interiors not structurally suited for recessed installations. These units are available in three types of mounting: 1—close-ceiling (C-5540), 2—stem suspension with ball and socket alignment (S-5540), 3—semi-recessed construction (R-5544). (See page 114).

Construction

The light controlling element consists of two parts—a prismatic reflector and a bottom bowl-shaped

refracting member in which there is a removable plate to permit easy relamping. These two parts are safely and securely joined as one unit by three rods which engage the bottom bowl and fasten to an annular ring in the neck of the reflector.

Fixtures are No. 22 gauge metal. Ceiling type fixtures are equipped with canopy cross bar and barrel nuts for mounting. Suspension type fixtures are of rigid $\frac{5}{8}$ " stem, ball and swivel construction with slip canopy, and are arranged for direct attachment to outlet box by suitable hickies and extensions furnished by the contractor. All fixtures are furnished wired complete. Standard finish is white metal. Enclosed construction improves maintenance; easy cleaning restores the high original efficiency.

Spacing

For uniform horizontal illumination, spacings should not exceed $1\frac{1}{4}$ times the mounting height above the work.

HOLOPHANE SEMI-DIRECT REFLECTOR-REFRACTOR

Suspension Type

Ceiling Type

Distribution Curve

A. No. C-2130 200 Watts
B. No. C-2133 200 Watts

The Holophane Reflector-Refractor is the ideal direct lighting unit. Its efficient light controlling qualities assure the greatest possible amount of light delivered to the working areas, where it is needed. The sparkling prismatic crystal glass together with the satin nickel fixture design presents a harmonious combination for present-day general lighting purposes. It is especially suitable for public building spaces, school laboratories and general

service areas or for offices and classrooms where ceiling conditions do not permit the use of semi-indirect luminaires.

Reflector-Refractor Characteristics

1. Direct distribution (70% of output downward and 30% upward).
2. Minimum flux at glare angles.
3. Maximum efficiency.
4. Minimum dust depreciation.
5. Extensive or Intensive distribution.
6. Attractive appearance.
7. Ease in re-lamping.

Construction

Fixtures are of 22 gauge metal of smooth contour design. Ceiling type fixtures are provided with crossbar and barrel nuts for mounting. Suspension fixtures are of rigid stem, ball and swivel construction with drop canopy and terminate in a $\frac{3}{8}$ " female hickey for direct attachment to outlet box by suitable hickies and extensions furnished by the contractor. All fixtures are furnished wired complete. Standard finish is white metal.

Reflector-Refractors are easily re-lamped by removing bottom cup.

Spacing

Intensive units should be spaced on centres not exceeding $1\frac{1}{4}$ times the mounting height. Extensive units should be spaced on centres not exceeding 2 times the mounting height.

For additional length rod hangers, add \$0.70 per foot or fraction thereof

HOLOPHANE BOWL REFLECTOR LUMINAIRE

No. S-5640

Distribution Curve
No. S-5640 500 Watts

These units are ideal for the lighting of offices, classrooms and other locations where constant fine-detail work is performed. Maximum eye comfort is provided by the absence of shadows and the low brightness of the luminaires. Prismatic action in the outer skirt bends the light out at wide angles over the ceiling without spots, streaks or shadows.

Graceful contour and excellent fixture design give these units broad architectural adaptability.

Construction

The fixture has a typical stem suspension, with ball and socket aligner. The husk supports a crystal-glass fluted prismatic bowl by means of three rods terminating in the flattened portion. Interchangeable glass rings, fitting in the bottom opening, take care of the variation in lamp size and constitute the only difference between the two units.

HOLOPHANE SEMI-INDIRECT FILTERLITE

Suspension Type
No. F-200

Ceiling Type No. CF-200

Distribution Curve
No. F-200 300 Watts

The "Filterlite"† is admirably suited for office or similar work because of the outstanding characteristics listed below.

1. Semi-indirect distribution (80% of output upward—20% downward).
2. High efficiency.
3. Low brightness.
4. No permanent deterioration.
5. Wide spread ceiling light.
6. No shadows or streaks.

Construction

The unit is smooth outside and tightly enclosed. The upper portion is sloped so that a minimum of dust gathers on the surface. The lower section of the bottom piece is backed-up with a dense diffusing glass liner. The fixtures are finished white metal.

HOLOPHANE SHOW WINDOW REFLECTORS

No. 983

Section No. 915

No. 940 with No. 0205 Finishing Ring

Distribution Curve
No. 983 150 WattsDistribution Curve
No. 915 300 WattsDistribution Curve
No. 940 150 Watts

Modern merchandisers know that the display must be well lighted if a show window is to attract the attention desired. This means high lighting levels, correct colour value and proper distribution of the light.

Holophane incandescent show window reflectors produce these desired effects. They have the highest efficiency, which means that high illumination levels can be obtained; the crystal prismatic reflectors do not change the colour of the light from the lamp—the colour of light from the incandescent lamp gives true overall appearance to merchandise; the light control from this line of reflectors is exact, which means the light is properly distributed over the display and within the window area.

The Holophane line of show-window reflectors is summarized as follows:

1. No. 983 is for surface mounting only. It is best used in small or medium-sized average-depth windows. No. 983 may be spaced on centres between

12" and 18" apart. With 150 watt lamps use a type "H" 2 1/4" holder. 100 watt lamps can be used with the same holder by inserting a 1 3/8" socket extension; otherwise, use a form "O" 2 1/4" holder. Holders and socket accessories are not furnished by the Holophane Company.

2. No. 940 is for recessed or surface mounting. It has a highly concentrating beam for shallow-depth and fairly high windows. Minimum spacing is 12 5/8". Used with 2 1/4" holder. The finishing ring, No. 0205, and plaster ring, No. 0201, must be purchased separately.

3. No. 915 is adaptable to either recessed or surface mounting. Its best application is in medium-sized average-depth windows. The closest spacing for the surface mounted unit is 11". The unit is complete with fitter No. 0945, for 4" outlet box mounting. When used in the recessed form, these reflectors may be spaced on minimum centres of 13 3/4". The finishing ring No. 0701 and plaster ring No. 0700 must be purchased separately.

Distribution Curve
No. 685-B 750 Watts

Distribution Curve
No. 682-B 750 Watts

Holophane Lobay units feature the choice of three reflectors with focusing, intensive and extensive distributions. The housings are identical and the reflectors may be interchanged (except 684), or covers added, at any time without disconnecting the fixtures. These units provide the advantage of light transmission to the ceiling, which improves the appearance of the interior.

FOR USE WITH SCREW BASE LAMPS

Construction

The reflector is supported at the bottom in a holding ring and clamped up against the fitter by means of three threaded rods and nuts. Reflector has a 30° shielding angle, effectively preventing glare.

Spacing

No. 684 and 685 should not be spaced more than 1½ times the mounting height; No. 686 no more than 0.75 times the mounting height; No. 682 no more than 2 times the mounting height.

FOR USE WITH 750 W BI-POST LAMP

No. 682-B is used for low bay locations where a wide-spread, even light distribution is desired. No. 685-B is recommended for low bay locations where mounting heights are greater or where extra high footcandle values are required. No. 686-B is designed for higher-than-average low bay mounting heights, and where a concentrated light is necessary for detail work.

Construction

The prismatic glass reflector is securely held in position by a tripod support. A simple hinge action allows easy removal of the reflector for cleaning. Open bi-post socket construction permits free ventilation. Reflector has a 30° shielding angle, effectively eliminating glare.

Spacing

No. 682-B not greater than 2 times the mounting height. No. 685-B not greater than 1½ times the mounting height. No. 686-B not greater than 0.75 times the mounting height.

HOLOPHANE LOBAY REFLECTORS

FOR USE WITH 400 W MERCURY LAMP

No. 645

Distribution Curve
No. 645

This unit is logically applied where higher light intensities are required and where the available wattage is limited. Especially recommended for lighting in the metal and aircraft industries.

A 30° shielding angle plus the deep reflector construction which keeps the elongated mercury lamp high in the reflector eliminates glare at all normal angles of view.

For ordinary conditions of general illumination this unit will produce approximately 20 footcandles per watt per square foot of floor area. Space units not greater than 1 1/4 times the mounting height.

HOLOPHANE ONE-POINT-FIVE LOBAY REFLECTORS

Nos. 606, 615 or 620

Distribution Curve
No. 615 150 Watts

These low cost units are designed to provide adequate, even illumination on spacings as great as 1 1/2 times the mounting height above the work. Units are designed with a shielding angle of 25° to effectively eliminate glare. Economical to install and operate. Three sizes are available to accommodate lamps ranging from 25 to 300 watts.

Fixture parts are made of heavy gauge steel.

Nos. 606-BC, 615-BC, or 620-BC

Nos. B-606 or B-615

Reflectors are of heavy pressed prismatic glass with reinforcing flange at bottom edge.

No. 606, 615 and 620 are tapped for 1/2 inch conduit. No. 606-BC, 615-BC and 620-BC are for mounting directly on 3 1/4 inch or 4 inch outlet box. No. B-606 and B-615 are wall bracket types. They terminate in a 3/8" female hickey for direct attachment to outlet box.

HOLOPHANE HIBAY REFLECTORS

Typical Hibay Reflector

Distribution Curve
No. 690 1000 WattsDistribution Curve
No. 691 1000 Watts

Distribution Curve No. 692 1000 Watts

Craelite No. 694

Where lighting units are mounted at great heights—such as are found in heavy industry, turbine rooms, etc.—the use of intensive and concentrating light distribution is a necessity; otherwise, a large portion of the light will be wasted on the upper side walls or intercepted by the mass of the machinery itself.

Holophane Hibay Units are designed specifically for this application, both from the standpoint of the illumination results and the mechanical ruggedness required. Some of their advantages are:

1. Three highly efficient prismatic reflectors from which to choose the distribution which gives the greatest usable illumination for any given room proportion.
2. Adjustments in lamp positions in each make it possible to obtain intermediate settings between standard distributions.
3. Corrosive atmospheres will not permanently affect glass reflecting surfaces.

Spacing

No. 690 not to exceed 0.6 times the mounting height. No. 691 not to exceed 1.0 times the mounting height. No. 692 not to exceed 1.75 times the mounting height.

HOLOPHANE CRAELITE

Holophane Engineers have designed an efficient, rugged lighting unit which will withstand the whip and vibration produced by the crane movements and at the same time provide a concentrating distribution.

Construction

Three compound double action steel springs absorb shock up and down as well as sideways. These springs are adjustable for tension. The Craelite is fastened to the crane by a 10 1/4 inch diameter, 1/2 inch thick plate. Wide flange construction assures solid contact with the crane. The socket is provided with a 3/4 inch female pipe thread for wiring.

The Craelite is supplied with a locked-on aluminum cover to prevent any light being directed upward to the operator's eyes.

Installation

Space units 20' apart across the crane. The Craelite when installed under the catwalk is relamped by raising a section of the catwalk. When mounted on the edge of the catwalk it is swung up for relamping by using an angle section attached to the catwalk.

HOLOPHANE VAPOUR-TIGHT UNITS

No. 02328

Distribution Curve
Nos. 02328 or 02368 150 Watts

Nos. 02368 or 02378

Distribution Curve
No. 02338 200 Watts

No. 02338

These units are essential for lighting high humidity areas in acid plants, artificial leather factories, boatbuilding plants, breweries, dye manufacturing, paint and varnish plants, rayon plants and similar industries.

Construction

The cast metal threaded fitter is accurately machined, and tapped for $\frac{1}{2}$ " conduit. A heavy,

durable gasket ensures vapour-tight fit. The upper part of the globe reflects the light to the lower member which diffuses and distributes it effectively over the work area.

Spacing

No. 02328 not greater than $2\frac{1}{4}$ times the mounting height. No. 02368 and 02378 not greater than 2 times the mounting height. No. 02338 not greater than the mounting height.

HEAVY DUTY REFRACTOR UNITS

Holophane symmetric and asymmetric wide-spread refractor units are designed to light industrial yards for protection against theft, and for production and storage purposes.

No. 04338 and 04333 symmetric units collect the light from the lamp and spread it out at wide angles. Spacings as great as 12 times the mounting height can be used.

Some locations are more effectively lighted with units having an asymmetric distribution. For example, long passageways between buildings are best lighted by refractors having a fan-shaped distribution. No. 04377 and 04179 effectively provide such a distribution.

Construction

The weatherproof cast aluminum fixture, coupled with the heavy duty refractor, makes a lighting unit of unusual durability. The inner and outer

surfaces of the two-piece refractor are smooth, allowing easy cleaning. Top of fixture is tapped 1½ inch female thread.

SMALL REFRACTOR UNITS

No. 830 and 832 symmetric units are useful where the area to be lighted is limited, such as over doorways, in small parking areas, underpasses, warehouses, etc. Spacing up to 6 times the mounting height is allowable.

Construction

Refractor is of two piece construction, smooth inside and out. Fixture is tapped for ½ inch conduit.

No. 0918 Bracket

This is a close fitting outdoor type bracket terminating at the wall end in a canopy to cover a 3¼" box. The fixture end has a standard ½" pipe thread.

HOLOPHANE WIDESPREAD REFRACTOLENS

No. U-818

Distribution Curve
No. U-818 200 Watts

There has always existed a demand for an outdoor lighting unit which could be: (1) recessed in a wall or placed flat against it, (2) would spread the light outward at a wide angle in a fan-shaped pattern. The uses for such a unit include parking yards, entrances, shipping platforms, underpasses.

Construction

The unit has a round cast aluminum housing which may be mounted against a wall or recessed to a depth of $3\frac{1}{2}$ inches. A cast door on the outer face carries a curved Refractolens consisting of an inner and outer prismatic lens, nested together. The prisms are between the two pieces and protected by a dust-tight seal. Three captive bolts hold the door tightly against the gaskets of the housing and make the unit weather-proof and bug-tight.

Spacing

Uniform illumination is obtained at maximum spacing of 4 times the mounting height.

Cat. No.	Price Each	Lamp Watts	Dimensions (In.)		Net Wt Ea	Std Pkg	
			Diam	Depth		Qty	Wt
U-818	\$63.00	200	16	$6\frac{3}{4}$	21	1	26

HOLOPHANE OUTDOOR SUB-STATION LIGHTING UNITS

No. 043386

Distribution Curve
No. 043386 500 Watts

No. 0871 Bracket

this application. Its upward spread of light is sufficiently broad so that units can be arranged to supplement each other. No. 043386 provides symmetric distribution, and 043776 asymmetric distribution.

Construction

The improved gasketed construction of the two-piece Holophane Refractor and the fixture parts ensures low permanent depreciation. By loosening a lock nut the entire unit may be rotated about its axis while burning and the angle of maximum candle-power can be made to coincide with the disconnect switches. The fixture body holds a diffusing element designed to distribute the downward light evenly over the ground.

No. 0871 Bracket is made of cast iron, hot dipped galvanized. Equipped with a 4" diameter box having four flanged supports drilled to pass $\frac{3}{8}$ " bolts.

The safe and efficient operation of an outdoor sub-station requires that the disconnect switches and other important apparatus be well lighted. The Holophane sub-station unit is ideally suited for

CURTIS X-RAY REFLECTORS

X-Ray
MADE IN CANADA
Reflectors

Fifty years of consistent improvement—through research and engineering—have brought X-Ray Reflectors to their present-day high standard of performance. Designed specifically to "put light where you need it," X-Ray Reflectors do so without sacrificing such important factors as eye-comfort, efficiency, durability and ease of installation. These requirements are fundamentals upon which all current styles are based.

X-Ray Reflectors are Tough. X-Ray Reflectors are not made from re-melted glass. They are made with particularly high-grade glass, crystal clear and free from discolorations and imperfections. Consequently, X-Ray Reflectors have diamond brightness and unusually tough texture.

These factors are vital in reflector design because they result in very low absorption and subsequent high reflector efficiency.

Silver Reflecting Surface. The reflecting element applied to the outer surface of the glass of X-Ray Reflectors is *pure silver*. Silver is used because it has the highest reflecting qualities obtainable. Once mirrored, the silver is then completely protected—on the inner side by the glass and by "Golden Armour" on the outer side.

Golden Armoured for Protection. X-Ray Reflectors have a golden finish on the outside. This finish is "Golden Armour." It is not copper, nor copper-like; instead it is a scientific process developed and perfected in Curtis Research Laboratories.

Golden Armour protects the reflector against tarnishing, cracking, blistering or discolouring; it keeps the silver bright, always as good as new.

Thus the loss of efficiency which occurs from deficiencies in other coatings, cannot happen with Golden Armoured X-Ray Reflectors—the silver reflecting surface stays bright: *you get all the light you pay for . . . always.*

Installation. X-Ray Reflectors are built to last years under normal conditions. Their inherent ruggedness ensures dependable, safe equipment with precise light control when installed with the simple, inexpensive fittings designed and listed for various applications.

Each type of X-Ray Reflector is designed with expert accuracy to do a specific job. This design, however, is only accurate when used with the proper lamp and holder as indicated in the following pages.

PLANNING CURTIS SHOW WINDOW LIGHTING

Deep Windows

Shallow Windows

Very Shallow Windows

TYPES OF SHOW WINDOWS

Deep Windows with a high background or trim (depth and height approximately equal) require *distributing* X-Ray Reflectors.

Shallow Windows with low trim or low background (depth about one-half the height) require *semi-concentrating* Reflectors.

Very Shallow Windows where the lower portion should be lighted as brightly as the upper, require *very concentrating* X-Ray Reflectors.

Island Windows (i.e. windows having glass on at least two long sides) are treated as double-shallow windows, back-to-back. *Semi-concentrating* X-Ray Reflectors should be used.

APPLICATION

Selecting the Correct Reflector. From the table at the right, it is easy to determine the proper reflector to use in any show window.

First locate your mounting height in the left column, "Height." In the next column find the depth of your window. Move along this horizontally to the column under "height of background or display" which corresponds to that of your window. The reflector designated in this space is the one to use.

Spacing of Reflectors. Spacing of reflectors is influenced by the brightness of neighbouring windows, street lighting intensity, goods displayed, colour of background, also the merchant's realization of the value of bright, well-lighted windows for advertising and sales value.

The closer reflectors are spaced, the brighter becomes the light in the window. In general, the following center-to-center spacing of reflectors is recommended:

Large cities, downtown	12"
Large cities, suburban	12" to 18"
Small cities	12" to 18"
Towns	15" to 24"

Height of Background or Display		1 to 2	2 to 4	4 to 6	6 to 8	8 to 10	10 to 12	12 to 14	14 to 16

CURTIS SHOW WINDOW REFLECTORS

ATTRACTION-ZONE TYPE

No. 420

X-RAY
Reflectors

Distribution Curve

Drawing shows No. 420 mounted on CurtiStrip with No. 15 Hanger. For recessing above ceiling use Finishing-Flange No. 10517. (Minimum recessing height 9 1/8", Dia. to cut hole 9 1/4".)

Drawing shows No. 530 recessed above ceiling of window using No. 14026 Finishing Flange. (Minimum recessing height 10 3/8", Dia. to cut hole 10 3/4".)

Drawing shows No. 1010 mounted on CurtiStrip using No. 19 fitting. No. 15 Hanger supports CurtiStrip from transom bar.

"Attraction-Zone" X-Ray Reflectors concentrate 35% to 50% more light in the lower portion of the window, thus giving a high-lighting effect which is sure to attract the attention of passers-by. They may be used for general lighting or to supplement general illumination. The added feature of "Attraction-Zone" X-Ray Reflectors is that they furnish high-level lighting at the important sales area. Reflectors have round bottoms for ease in recessing. "Dimples" are a feature in X-Ray Reflectors for readily attaching accessories.

Catalogue numbers 420 and 530 are used for average size windows. No. 1010 is for large shallow windows, or for high intensity "super-lighting."

Uses for No. 1010 "Blimp" besides show window lighting include the following applications—Stage Lighting: Theatres and Large Auditoriums. High Intensity Lighting: Indoor Athletic Tennis and Handball Courts. Churches: Sanctuary and Choir Lighting. Sports Lighting: Boxing and Wrestling Rings.

CURTIS SHOW WINDOW REFLECTORS

SEMI-CONCENTRATING AND DISTRIBUTING TYPES

No. 500

Distribution Curve
No. 11Distribution Curve
No. 500

Dimensions No. 11

X-RAY
Reflectors

Dimensions No. 500

Semi-concentrating Type. This Semi-concentrating X-Ray Reflector should be used in show windows where the mounting height of reflectors is greater than the depth of the windows.

Accurate light control is essential in such areas. It is necessary to provide adequate general illumination yet have a strong punch of light in the downward angle to properly light merchandise on display. Such achievement is exemplified by X-Ray Reflector No. 11.

Distributing Type. This X-Ray Reflector is designed for use in deep windows (those in which the depth of window is approximately equal to the height). Where the trim-line extends high at the back, it is ideal.

As its name implies, the distributing type reflector spreads light over a wide angle. Accurate control provides an abundance of light on the merchandise, thus increasing the sales appeal of the window.

CURTIS SHOW WINDOW REFLECTORS

CONCENTRATING TYPE

No. 844

Dimensions No. 844

X-Ray
Reflectors

Distribution
Curve

Dimensions No. 804

Concentrating Type. Where a "punch" of light is required on merchandise or eye-work, or where light must be effectively projected from a comparatively high mounting height, concentrating reflectors are used. The size of the reflector is determined by the intensity of illumination needed, also the height of mounting.

X-Ray Reflectors 844 and 804 furnish directional lighting with extreme concentration. Where such control is essential, X-Ray Reflectors are unexcelled.

Application

For emphasizing with light in the store, for pro-

viding high level supplementary lighting in the factory, for high bay mounting and for general spot-lighting, X-Ray concentrating reflectors are recommended.

Other Applications

Show window displays, spotlighting counters and merchandise, directional lighting for art galleries and museums (lighting recessed above skylight).

General illumination for large interiors, night protection lighting, church altar and chancel lighting, dance floors, and all high-lighting and spotlighting applications.

Cat. No.	Price Each	Lamp Watts	Holder† (Not included)	Accessories* (Not included)			Dimen (In)		Std Pkg

*For dimensions and prices, see page 135.

†Used only with X-Ray and CurtiStrip sockets. For prices see page 151.

‡Use No. 10300 holder plus No. 10012 holder extension for 150 watt lamp.

LOUVERS FOR CURTIS SHOW WINDOW REFLECTORS

Corner or island type windows often require a means of concealing the lamps and light from reflectors along the adjacent side. X-Ray Louvers are a standardized accessory that can be installed at any time in "dimpled" X-Ray Reflectors.

HOW TO RECESS CURTIS SHOW WINDOW REFLECTORS

Finishing flanges and plaster-rings are used in recessing X-Ray Reflectors above the show window ceiling. On wood or board ceilings, flanges only are used to finish off the opening and to support the reflector in the proper position. The exposed face of the

flange may be painted at the same time as the ceiling. When recessing is done in plaster ceilings, it is necessary to use a plaster-ring as a ground to plaster up to and also as a base for mounting the finishing flange. See diagram.

Detail showing installation in wood or board ceiling.

Above Left: Side view of reflector recessed with flange only. Above Right: Plan view of flange — use flange for pattern to cut opening.

Detail showing installation in plaster ceiling.

CURTIS INTERIOR FLOODLIGHTS

Concentrating Type Floodlight

Increased stopping and selling power usually result from added light on special features of show window and interior displays. X-Ray Interior Floodlights provide two types of light control:

Concentrating Type, with a very narrow beam for high-lighting, and Semi-concentrating Type that provides wider distribution for large areas.

CURTIS DIRECT LIGHTING REFLECTORS

Right: No. 588, typical of distributing type reflectors. Used at medium or low mounting heights it provides excellent light distribution over large areas.

Below: No. 2-588-H1, typical of Combination Mercury-Incandescent Fixtures.

This group of X-Ray Reflectors includes equipment for the efficient general lighting of industrial plants, commercial buildings, sports arenas and the like. The wide range of sizes offered in this group covers the requirements of large and small areas, high and low bays and individual localized applications. General lighting reflectors are essentially of a semi-concentrating or distributing character.

592-H1	26.10	400 Watts Mercury	1/2" female thread	16 1/2	19 1/2

*For Outlet Box, No. 575-OB (\$9.60 each) includes holder, socket and 4" OB cover. For 1/2" Conduit, No. 575-C (\$9.15 each) includes holder and receptacle with 1/2" female thread.

CURTIS RECESSED LIGHTING EQUIPMENT

Grocery store lighted with two rows of Curtis recessed units. Adequate, comfortable illumination is provided at low initial cost.

High levels of glare-free illumination provided by Curtis recessed units make it a pleasure to shop in this self-serve market.

Curtis recessed units are correctly engineered to produce high levels of illumination with a minimum amount of glare. All units are approved by C.S.A. when installed according to Code requirements.

The higher levels of illumination which research has shown to be necessary for good seeing and effective selling are economically and efficiently secured with Curtis recessed lighting.

Lighting with recessed equipment preserves the clean modern lines of an interior. They may be used alone or to supplement indirect lighting from ceiling fixtures and coves.

MAXIMUM ALLOWABLE SPACING:

(For resultant intensities see table page 139).

For distributing units, when used to produce lighting of fairly uniform intensity, the spacing permitted is $1\frac{1}{2}$ to $1\frac{3}{4}$ times the distance from the working plane to the unit. For example, where No. 588 or No. 575 (distributing) reflectors are to be used and the ceiling height is 12 feet, the distance from the working plane (approximately 3 feet from the floor) will be about 9 feet. The spacing, therefore, may be as much as 15 feet between units.

For semi-concentrating units, when used to produce lighting of fairly uniform intensity, the spacing permitted should not be greater than the distance from the unit to the working plane. For example, where No. 848 or No. 810 (semi-concentrating) reflectors are used and the ceiling height is 12 feet, the distance from the working plane to the unit

will be about 9 feet. The spacing between units, therefore, should not be greater than 9 feet. We recommend the use of semi-concentrating units rather than distributing units wherever the spacing is close enough to permit their use.

Concentrating units, such as those using No. 804 reflector are usually installed over displays and in locations where it is desired to obtain emphasis in lighting; they are rarely used for uniform lighting. Beam coverage is $1/3$ of the distance from the unit to the display. For example, if the unit is 9 feet above the counter, the circle of light in the main beam will be about 3 feet in diameter.

ACCESSORY EQUIPMENT

The information given above applies only to open recessed units with no cover glass or louver. Where these fittings are used, the characteristics of the light distribution will be somewhat modified. See tables page 139.

- (a) Cracked cover glass has little effect on light distribution but serves primarily to shield the lamp and reflector from view. In most cases, cracked glass should be used.
- (b) Sanded cover glass increases the brightness and also the spread of the reflector.
- (c) Louvers are primarily intended to shield the light source but also tend to increase the concentration of the light. When a louver is used, an improved appearance can be obtained through the use of a cover glass mounted above the louver.

CURTIS RECESSED LIGHTING EQUIPMENT

In this cheerful restaurant combined cove lighting and recessed downlighting provide useful light on the tables, as well as an attractive over-all appearance.

Curtis cove lighting and recessed lighting equipment add materially to the quiet restfulness and charm of this office-building lobby.

INSTALLATION SUGGESTIONS

Installation of these various types of equipment may be made in interiors with wood, metal, tile, concrete, acoustic, or plastered ceilings. In the case of plaster ceilings, the use of plaster ground rings simplifies installation and maintenance. Plaster rings are installed before plastering is done and the units placed in position later. Drawings on the following pages show methods of mounting.

PLASTER GROUND RINGS

Plaster ground rings are not included in complete unit numbers. Where a plaster ground ring

is required for installation, its catalogue number will be found conveniently listed on the same page as the unit itself under the heading "Plaster Ring."

LOUVERS FOR HOUSED AND UNHOUSED UNITS

Concentric Louvers

Design is simple and striking. Round—available in 7" (No. 12014), 10" (No. 12012) and 14" (No. 12013) sizes.

PLANNING RECESSED LIGHTING

The foot-candle readings in the tables below give values for the intensity of direct light on the horizontal plane at various distances below the unit. These readings were taken in a dark room by the light of a single unit, and represent an absolute minimum; in any actual installation the values in the tables will be substantially increased by reflected light and light from other units.

If a 500-watt lamp is to be used in place of a 300-watt lamp, the values should be increased in proportion to the lumen output of the lamps.

The horizontal intensities due to two or more units may be added directly, to obtain the total horizontal illumination at any point. The intervals in the tables have been chosen so that ordinary interpolation would give substantially correct results.

†May be used with control-ring louver No. 12844.

CURTIS ROUND-DEEP HOUSED RECESSED UNITS

The large (300-500 watt) round-deep type is available with 14" round cover glass, glass and louver in combination or louver only. The small (200 watt) round-deep type is available with 10" round cover glass, glass and louver in combination or louver only.

The catalogue numbers listed below are for complete assemblies as indicated. Plaster ground rings, if necessary, must be ordered separately.

The housing is made of 20 gauge steel, finished white inside and black outside. The X-Ray

reflector is mounted on a standard 4" outlet box with an X-Ray holder and porcelain socket. Knockouts are provided in the side of the housing opposite the knockouts in the outlet box. Housing has a flange at the bottom which can be used to support the unit from wood, metal or acoustic ceilings. The hinged rim is attached to this flange with machine screws to complete installation. Hinged rims are finished in warm grey. Wire guards are available, see page 138.

Plaster Ground Rings are required only on plaster ceilings. This ring is installed before plastering is done and the recessed units placed in position later.

For the large type, use Plaster Ring No. 14038. For the small type, use Plaster Ring No. 14010. Plaster rings must be specified as separate items; for prices see page 138.

†Add 1 1/4" to allow minimum clearance for removal of reflector.

CURTIS LOW-PRICED RECESSED UNITS

No. 2120-H equipped with louver No. 12022

Curtis low priced recessed units provide high levels of illumination on both vertical and horizontal planes. These features make the units ideal for stores where merchandise is displayed on shelves and tables.

Specifications: Each unit consists of silver mirror reflector which seats directly on the ceiling flange. Sockets are either medium base for 200-300 watt lamps or mogul for 300-500 watt lamps. Each is available with four-inch outlet box cover assembly or side outlet shell and socket assembly. The concentric louver (not included) is easily removed for cleaning or lamp replacement.

Dimensions: 2120-H or K. Reflector No. 588 used for 300-500 watt units is $11\frac{7}{8}$ " in diameter and requires a hole $12\frac{1}{2}$ " in diameter. The ceiling flange for this unit is $14\frac{7}{8}$ " in diameter.

2130-H or K. Reflector No. 575 used for 200-300 watt units is $9\frac{3}{8}$ " in diameter and requires a hole 10" in diameter. The ceiling flange for this unit is 12" in diameter.

Minimum Height:

2120-H— $13\frac{3}{8}$ "
2130-H— $10\frac{7}{8}$ "

2120-K— $14\frac{5}{8}$ "
2130-K— $11\frac{3}{8}$ "

Finish: Ceiling flange and louver are finished in warm grey.

Cat. No.	Price	Description
2120-H	\$18.80	300-500 watt unit with reflector No. 588, holder, ceiling flange, and side opening shell mogul socket assembly.
2120-K	18.45	300-500 watt unit with reflector No. 588, holder, ceiling flange and four-inch outlet box cover and mogul socket.
12022*	8.10	Louver for 2120 H or K.
14312*	2.35	Plaster ring for 2120 H or K.
2130-H	13.15	200-300 watt unit with reflector No. 575, holder, ceiling flange and side opening shell medium base socket assembly.
2130-K	12.80	200-300 watt unit with reflector No. 575, holder, ceiling flange and four-inch outlet box cover and medium base socket.
12023*	10.80	Louver for 2130 H or K.
14028*	2.35	Plaster ring for 2130 H or K.

*Not included with units. Order separately when needed.

Illumination Data 2120 H and K

Foot-candle readings with 500 watt inside frosted lamps. For 300 watt multiply by .6. For 200 watt multiply by .4. Spacing for best results not to exceed ceiling height.

Ceiling height	Area per outlet Square feet	AVERAGE FOOT-CANDLES—MAINTAINED†		
		Large room	Medium room	Small room
		4 or more units in each direction	2 or 3 rows of units	1 row of units

†Depreciation factor of 25% has been deducted from initial readings.

PLANNING INDIRECT LIGHTING

The **first** step in planning any lighting installation is to correctly determine the lighting intensity in foot-candles desired in the interior. This selection for a particular installation will depend upon actual purposes and conditions for which the interior is to be used. Accuracy and minuteness of business and industrial operations, colour of materials worked on or handled, merchandising exigencies, and other factors affect the determination of correct lighting level.

OUTLET LOCATION AND WATTAGE

Second—from floor plan of room to be lighted

find area, arrangement of outlets and determine wattage per outlet. The architectural features . . . columns, bays, beams, etc. . . will generally determine location of outlets. Areas indicated below are largest that should be lighted from one pendent luminaire.

Average Area per Outlet in Square Feet	Ceiling Height	Watts per Outlet to Produce		
		6 to 10 Foot-Candles	10 to 15 Foot-Candles	15 to 25 Foot-Candles
81	9 ft.	...	200	300
100 to 144	9'5" to 11'0"	200	300	500
169 to 225	11'5" to 15'0"	300	500	750
256	16 ft.	500	750	1000

For best lighting results the colour of the ceiling should be mat finish ivory, white, or light cream. The upper walls should preferably be light in colour as this has a direct bearing on the efficiency of the lighting system. The following table indicates percentages of light reflected by various colours:

Flat white.....82%	Light gray.....60%
Ivory-white.....78%	Light green.....55%
Cream.....74%	Buff.....55%
Caen stone.....70%	Tan.....40%
Ivory tan.....65%	French gray.....35%

CURTIS LUMINOUS INDIRECT LUMINAIRE

A new luminous indirect fixture of special glass. Styled by the eminent Walter W. Kantack and developed by Curtis Engineers to produce a high efficiency and wide distribution of light. The

bowl is made of heavy glass having a graduated thickness, low surface brightness, high reflectivity. The "Tusk-Tone" (ivory of graduated density) colour of the bowl gives a pleasingly warm effect and harmonizes with any interior decorative scheme.

This fixture is particularly suitable for schools, restaurants, stores, offices and locations where soft, indirect light with a luminous lighting source of very low brightness is desired.

Installation is easy—The stem-hanger requires no threading and may be shortened on the job. A self-aligning fitting in the canopy permits the luminaire to hang evenly.

Maintenance is easy—Relamping and cleaning is readily accomplished by allowing the bowl to swing down on two of the three arms projecting from the socket cover.

Hanger finished in satin aluminum.

CURTIS "EDGE-RAY" LUMINAIRES

No. 1250 "EDGE-RAY" INDIRECT

"Edge-Ray" luminaire is especially suited to distinctive interiors where both efficient indirect lighting and beauty in the luminaire are essential.

"EDGE-RAY" LUMINAIRES

The unusual beauty of "Edge-Ray" luminaires is best appreciated by actually seeing them lighted. Soft luminous sheen surrounds the silvery aluminum bowl exterior . . . the result from an exclusive Curtis feature. Atop the bowl is a reflector ring which redirects a small portion of the light downward on to the bowl . . . the graining of the bowl and the concentric vertical bands pick up this light. Viewed from below, the indirect "Edge-Ray" luminaires effect an interesting array of softly

No. 1260 "EDGE-MONT" DIRECT-INDIRECT

"Edge-Mont" is the "Edge-Ray" style luminaire for direct-indirect lighting. Concentric-ring, staggered steel louvers are centered in the bottom of the bowl. These louvers (painted mat gray) control the strong "plus" light which is directed down on the selling level.

lighted circles. Decorative colour is added by colouring the underside of the reflector ring. (This will be done at the factory at a slight additional cost). Colours and prices on request. "Edge-Ray" luminaires shown here may be used harmoniously and intelligently in the same interior for various types of lighting and locations, or an entire room may be lighted with a single type. Made of aluminum. Equipped with an X-Ray reflector.

Finished in lustrous aluminum.

CURTIS INDIRECT LUMINAIRES

"ECLIPSE"

A unit which uses the same X-Ray reflector as the "Winner," and is equally efficient. With its shallower bowl it is adaptable to areas with lower ceiling height.

"WINNER"

This is a totally indirect luminaire embodying simplicity and trimness in style with maximum lighting efficiency. Recommended for those interiors where close eye-work is performed—offices, schools, drafting rooms.

Curtis Indirect luminaires, with concealed X-Ray reflectors, produce a high intensity of glareless light that is evenly distributed throughout the room. With no bright spots and almost shadowless lighting, these luminaires provide the type of illumination that is easy on the eyes and this insures fast, accurate, comfortable work.

Similar in construction to those used for show window lighting, the X-Ray silver-mirrored reflectors embodied in the design of these indirect luminaires offer distinctive advantages not found in ordinary fixtures.

The scientific design and high efficiency of X-Ray reflectors insure accurate light control and maximum light output. The heavy coating of silver and the exclusive Golden Armour process insures a uniform reflecting surface throughout life.

Maintenance is easy with X-Ray reflectors. Simply by wiping dust from the glass reflector, the unit can be restored to initial efficiency. There is nothing to corrode; nothing to depreciate.

X-Ray reflectors, the heart of Curtis Indirect luminaires, are made in varying shapes and with different corrugations in the glass. This gives the proper light control in accordance with the requirements of the lamp. These shapes and corrugations are determined in the laboratories of Curtis Lighting and are a result of fifty years of experience in the lighting field.

CURTIS ALZAK LUMINAIRE

THE "RIVAL"

"THE RIVAL"

An attractive luminaire with Alzak aluminum reflecting surface. A superior method of processing the aluminum has been used under the Alzak patents to produce a hard, clear, crystalline permanent surface—the qualities necessary for a highly efficient, heat resisting reflecting surface. For efficient delivery of comfortable glareless light this unit is outstanding and with its neat appearance and moderate cost is very popular for schools, offices and stores. Finished in emiered aluminum.

CURTIS BOWL REFLECTOR LUMINAIRE

"L'ORION"

"L'ORION"

A tailored design for use with bowl reflector lamp. Moderately priced, with trim, smooth flowing lines that enhance modern architectural schemes, this luminaire is in great favour for soft, even, glareless illumination in the classroom and business interior. Lamps are conveniently accessible for replacement from below. Finish is in satin aluminum.

CURTIS COVE LIGHTING EQUIPMENT

Curtis cove lighting equipment makes possible an unusual architectural treatment in this large department store.

Because it is built in, or permanently affixed to, the architectural elements of an interior, competent engineering, planning, designing, and installation are required to make cove lighting successful.

Cove lighting installations differ, each presenting an individual engineering problem. Services of our Lighting Service Department are available, and will be helpful to prospective users of cove lighting.

PLACEMENT OF THE COVE

Location of the cove on the wall, in relation to the flat ceiling, is explained in the diagram. Distance down from the ceiling should permit proper distribution of light; this distance will necessarily be greater for wide rooms than for narrow rooms since it is necessary to project the light farther to the center of the ceiling area. Obviously, the construction of the walls will limit the size of the cove.

Shape and design of the cove will be influenced by the architecture of the interior. The ideal condition is an unobstructed ceiling, flat or slightly arched. (Unusual ceilings require special consideration.)

Upper wall and ceiling surface finish and colour are important considerations influencing indirect lighting efficiency. For best results use white, cream or ivory mat finish. These have a reflection factor of 75% to 85%. Pale pastel colours . . . from 50% to 75%; acoustical materials in natural finish . . . from 25% to 75%.

FLUORESCENT COVE LIGHTING

In properly engineered applications of fluorescent cove lighting, under favorable conditions, 1 watt per square foot will produce 6 to 10 foot candles.

Fluorescent equipment suitable for cove lighting is more fully described on page 66.

Section showing location of the cove on wall, in relation to the flat ceiling. Note: To reduce size of cove, equipment may be recessed to front edge of reflector.

SPACING OF X-RAY REFLECTORS

Data for permissible spacings for each reflector will be found on the next page. These spacing recommendations assume that the distance of the ceiling above the lamp center is never less than one-tenth the room width.

WATTAGE

A general rule for specifying wattage for cove lighting is that one watt per square foot will give 2 to 4 foot-candles. The higher figure compares satisfactorily with the efficiency to be expected from indirect pendent luminaires installed. However, it is obtainable only under favorable installation conditions; i.e., in fairly large rooms with very light walls and ceiling with the cove located far enough below the ceiling to permit maximum utilization of the light.

INSTALLATION METHODS

The following page presents typical installation diagrams for X-Ray cove reflectors mounted on CurtiStrip (CurtiStrip comes unwired). In simple coves, the reflectors are usually mounted in front of the wall, as shown in the diagram above. When a small cove is desired, equipment may be partially recessed into the wall up to the front edge of the reflector.

MAINTENANCE

Careful consideration should be given to the maintenance of lighting coves. The reflector equipment must be periodically dusted and the lamps normally replaced to insure continuous efficiency. If the location of the cove prohibits easy access from the front, special maintenance arrangements must be made to facilitate accessibility from behind.

CURTIS COVE LIGHTING EQUIPMENT

Cove lighting reflectors on CurtiStrip

Section showing No. 8356 on CurtiStrip

Section showing No. 8360 or No. 8364 on CurtiStrip

Concentrating Type X-Ray cove reflectors act as small powerful floodlights in projecting light to the center ceiling area. It is essential that this type be used in wide rooms, and/or where cove is mounted very near the ceiling. These reflectors may be closely spaced for high intensity cove lighting.

By tilting the socket or wireway, these reflectors may be mounted at any angle necessary to gain the desired light projection.

Complete fittings are available for concentrating reflectors which permit their installation under a variety of conditions.

CURTISTRIP EQUIPMENT

CurtiStrip is a large capacity (30 No. 14 R. C. wires) wiring channel and raceway that offers unusual flexibility and a wide range of uses with its standardized fittings. The patented snap-in flat cover permits outlets to be installed on any spacing. The cover, placed between sockets or fittings, is cut to length required with tinner's shears and snaps into the lips of the channel. Channel may be cut to any length with a hacksaw. Sections longer than 10 feet may be coupled together to form a continuous channel.

CURTISTRIP CHANNEL AND COVER

Channel and cover made of 20-gauge cold rolled steel, cadmium plated. Size, 2 1/2" wide by 1 5/8" deep.

Cat. No.	Price Per ft.	Description	Std Pkg
1	\$0.80	Channel with cover, 10 ft. lengths	100 ft.
1-A	.63	Channel only, 10 ft. lengths	100 ft.
1-B	.18	Cover only, 10 ft. lengths	100 ft.

CURTISTRIP SUPPORTS

These five standard hangers offer complete flexibility for mounting CurtiStrip.

Fitting	Cat. No.	Price Each	Description	Std Pkg
	9	\$0.15	Strap for holding CurtiStrip against any flat surface	10
	13	.80	Bracket to hang CurtiStrip on pipe or chain hanger	10
	24	2.45	Bracket assembly	10
	2	1.80	Universal Hanger. Includes two-piece perforated hanger, one strap, 4 angle brackets and 6 bolts	10
	15	.88	Hanger for mounting CurtiStrip on transom bar or side wall	10

CURTISTRIP FITTINGS

Standard Finish: Cadmium Plate

Fitting	Cat. No.	Price Each	Description	Std Pkg
	6	\$0.22	End cap for closing ends of CurtiStrip. Has 1/4" knockout	10
	12	3.00	Service box for connecting 3/4" to 1 1/2" conduit to CurtiStrip	1
	14	2.90	Adjustable elbow for angles of 70° to 180°	1
	16	.54	Coupling for connecting two pieces of CurtiStrip	10
	18	.95	Box Adapter fits CurtiStrip to standard 4" outlet box	10
	21	.88	Switch Plate mounting. Takes standard toggle switch	10

SOCKETS AND RECEPTACLES

CurtiStrip sockets and receptacles can be spaced as close as 2 3/4" on centers. Two-piece construction simplifies wiring.

Fitting	Cat. No.	Price Each	Description	Std Pkg
	5	\$0.90	Standard porcelain socket with shade holder groove	50
	5-A	.90	Special porcelain socket, no shade holder groove	50
	8	1.80	Porcelain angle socket for X-Ray cove reflectors	50
	19	.90	Nipple attachment for 3/8" conduit or fittings	10
	19-BX	.72	Attachment for 1/2" BX or Greenfield	10
	20	.88	Single Receptacle plate. Takes all standard receptacles	10
	23	.88	Duplex Receptacle plate. Takes all standard receptacles	10

FLUORESCENT CURTISTRIP

FLUORESCENT CURTISTRIP

Fluorescent lamps can be used with CurtiStrip. Ballasts are available which fit inside the channel and a complete line of fittings and reflectors provide means of mounting the lamps and efficiently directing the light. For complete details see page 66.

Fluorescent CurtiStrip can be made up in continuous runs or in individual units. The reflectors and lamps can be placed end to end or spaced out at any desired distance. The line wires can be fed in one end and carried through the CurtiStrip, reducing wiring costs.

Reflectors are available in three shapes, semi-concentrating, distributing and directional for 18", 24", 36" or 48" lamps. The reflectors are carefully designed to take maximum advantage of the high efficiency of the fluorescent lamp. Correct contours avoid trapping of light, such as occurs with inferior equipment, and the variety of reflector shapes insures the correct distribution for every application.

GENERAL ELECTRIC "COMMODORE"

General Electric Commodores provide excellent semi-indirect or luminous indirect illumination for offices, drafting rooms, class-rooms and other interiors where quality incandescent lighting is desired. Commodore luminaires blend into the ceiling and have no black spots, no dark rings, no glaring spots of brightness. The quality of illumination which they provide is similar to soft, pleasant sky light.

Commodores are manufactured in a complete series for wattages from 200 W to 1000 W. All hangers and reflectors are similarly styled, so that an installation requiring units which utilize various sizes of lamps and reflectors will have complete uniformity of appearance.

Commodore reflectors are molded from a urea-formaldehyde compound which is light in weight, yet very hard and resilient. Reflector attaches to hanger by a simple bead chain and wire suspension which can be quickly disengaged for cleaning or relamping. Reflectors are white as shown in the tabulation below. Hangers are made of aluminum, finished in satin aluminum. Canopies are provided with a knockout for canopy switch.

Permanence

As long as Commodore units are hung without any change in construction after they leave the factory, and are properly maintained while in

Cat. No.	Price Each	Lamp Watts	Colour	Dimensions (Inches)		Socket	Standard Package

thoroughly washed. A warm soap solution containing any mild water softener such as Tri-Sodium Phosphate, Borax or Calgon is recommended.

Performance Table

In reading these figures, the following lighting concepts should be borne in mind:

Low Surface Brightness: Surface brightness should be sufficiently low to prevent glare from the reflector.

Downward and Upward Component: The ratio of the downward and upward component determines whether the unit can be classified as a semi-indirect or indirect unit. By varying the density of the molding powder, the same size reflector can often qualify for both of these categories.

service, the reflectors are warranted not to deteriorate. They will not support combustion and will only char when submitted to high temperatures.

Overall Efficiency

For an economical lighting installation, a high overall efficiency is essential. High efficiency readings are often sacrificed in Commodore units, however, in order to keep the surface brightness figure low. This provides for comfortable seeing without glare.

Maintenance

If Commodore reflectors are dusted on a regular schedule, their original efficiency will be maintained over a long period of time. In addition, reflectors should be taken down at definite intervals and

THE "SUPERLUX"

Distribution Curve

This semi-indirect luminaire provides comfortable illumination for schools, offices, stores and similar locations. The luminous glass bowl blends with the ceiling, thus eliminating brightness contrasts within the field of view.

Approximately 92% of total light output is directed upward, and 8% downward. Bowl bright-

ness does not exceed 0.8 candle power per square inch. Overall efficiency is 82.5%. Hangers are finished in satin chrome.

FLUSH BOXES

Round

Square

Rectangular

Semi-Flush

These recessed fixtures are ideal for general lighting in smart shops, auditoriums, corridors, and any locations where inconspicuous fixtures are desired. They are suitable for areas where head-room is restricted, such as play-rooms, kitchens, and under mezzanines.

Round, square, and rectangular flush fixtures

are supplied with flat, flashed-opal glass. Semi-flush fixtures are available with one (No. 7465) or two (No. 7466) square opal bowls.

Frames are finished in polished chrome. Inside of box finished baked white enamel. Outside is asbestos covered.

ENCLOSING GLOBES

The Keystone

The Seville

The Pilgrim

The "Keystone," being smart and streamlined in appearance, will meet the popular demands of modern lighting. It is made from "Monax" glass of high efficiency for general diffuse lighting.

The "Seville" has long been a popular "Monax" brand lighting globe. It is economical, efficient and widely used for all types of general diffuse illumination. This unit has the "Chip Proof" fitter.

Simplicity of design coupled with the high efficiency of "Monax" glass characterizes the "Pilgrim" as an especially desirable globe for general diffuse illumination.

"Monax" is a white glass with excellent diffusing qualities.

ENCLOSING GLOBES

The Clipper

The Trojan

The Juno

The "Clipper" is available in two types of glass. Silvaglo — a white opal glass of high efficiency, for direct lighting; L.S.B. (Low Surface Brightness) — an indirect glass, having a clear upper portion, and a dense white lower portion.

The Ivanhoe Trojan distributes diffused light both above and below the mounting plane. The

light density Genco glass produces pleasing, delightful illumination in all directions without sharp shadows or annoying glare.

The contour of the Juno is a desirable variation from the typical enclosing globe and is designed for efficient distribution and minimum brightness.

EQUIPMENT FOR R-40 AND PAR-38 LAMPS

No. 1947

No. ES40A, ES40C

No. HRL45, SL45

No. 30R

No. 3948

No. 3955

No. 3948

Indoor stand for R-40 and PAR-38 lamps. Adjustable to any angle. Finished in polished chrome. Complete with shell push-through socket, and 6 foot cord and attachment cap.

No. 3955

Weatherproof stand for outdoor use with PAR-38 lamps. May be adjusted to any angle. Finished in copper with cadmium plated trunnion support. Supplied with porcelain socket, 6 foot cord and attachment cap.

Coloured Lenses

Available in standard non-heat resisting glass for indoor use, or in heat resisting glass for outdoor use. Four colours are available; Green, Amber, Red and Blue.

Lens Holder Rings

Two types are available; ES40A for PAR-38 lamps, and ES40C for R-40 lamps.

No. 30R—Glare Shield

Prevents direct viewing of PAR-38 lamp, and

concentrates its beam. Interior is finished in dead-black, exterior polished aluminum.

No. 1947—Clamp-Type Holder

A handy, inexpensive holder which clamps easily to chairs, beds, tables, etc. Extension arm 6½" long; has ball joints at each end for complete flexibility. For use with reflector type R-40 lamps. Supplied with 6-foot rubber cord and attachment cap.

"SPOT-O-LITE" LINE FOR R-40 AND PAR-38 LAMPS

No. 5571

No. 5565

No. 5574

No. 5576

No. 5560

No. 5570

No. 5575

This line of indoor type spotlights provides many answers to the problem of highlighting special displays and show windows.

Construction

The heavy cast iron base can be screwed or bolted to any flat surface, or if desired will attach directly to 3 1/4" or 4" outlet boxes. All types except No. 5576 are equipped with a sturdy universal swivel. A streamlined housing finished in brushed aluminum is furnished with all units except No. 5560. Supplied with porcelain socket and wired with leads only, except No. 5560 and 5570 which are supplied with 6-foot rubber cord and plug.

No. 5560—Spotlight Stand

Ideal for economically highlighting special displays or show windows. Also suitable for use with reflector type heat-lamps, sun-lamps and photo-floods.

No. 5565—Down-Lighting Unit

A ceiling mounted unit for spotlighting special merchandise.

No. 5570—Spotlight Stand

An exceptionally smart, streamlined stand for highlighting displays.

No. 5571—Suspension Type Spotlight

For highlighting special merchandise on counters or in shadow boxes. Standard over-all length, 30 inches.

No. 5574—Suspension Type Spotlight

Similar to No. 5571 except that swivel is located at side of housing, to permit highlighting of shadow boxes and vertical displays.

No. 5575—Wall Mounting Spotlight

Although designed as a wall bracket type, this spotlight with truncated housing is suitable for many applications.

No. 5576—Flexible Arm Spotlight

Designers, architects and up-to-the-minute store owners will find many uses for this unit. The 15" flexible arm permits the user to create his own styles to suit a variety of purposes.

Accessories

All streamlined housings except the truncated type (No. 5575) will accommodate No. 5587 concentric ring louver, with or without No. 5586 coloured lens. (See next page).

No. 5548

No. 5580

No. 5581

No. 5582

No. 5583

No. 5548—Adjustable Enclosed Down-Light

An excellent unit for highlighting displays. The square face plate is 12" wide for incorporation in continuous rows of recessed fluorescent fixtures. The lamp is inserted in gimbals which permit a 30 degree adjustment in any direction. Face plate finished in white baked enamel.

No. 5580—Adjustable Enclosed Down-Light

For flush mounting where ceiling depth is limited. Gimbals permit 30 degree adjustment. Ceiling ring finished in polished chrome.

No. 5581—Adjustable Open Down-Light

For flush mounting where ceiling depth permits free circulation of air. Gimbals permit 30 degree adjustment. Ceiling ring finished in polished chrome.

No. 5582—Fixed Enclosed Down-Light

For flush mounting where ceiling depth is limited. Ceiling ring finished in polished chrome.

No. 5583—Fixed Open Down-Light

For flush mounting where ceiling depth permits free circulation of air. Ceiling ring finished in polished chrome.

SPOT-O-LITE ACCESSORIES

No. 5584

No. 5585

No. 5586

No. 5587

No. 5584—Clip-On Holder.

Suitable for all recessed Spot-O-Lites. May also be attached to R-40 lamps when used in No. 5560 spotlight stand. Accommodates No. 5585 concentric ring louver and No. 5586 coloured lens, either in combination or separately.

No. 5585—Concentric Ring Louver

Provides good lamp shielding. Used with No. 5584 holder.

No. 5586—Coloured Lens

For dramatizing displays or creating the seasonal touch. Used with No. 5584 holder or No. 5587 louver. Available in red, amber, green or blue.

No. 5587—Concentric Ring Louver

For use with all streamlined housings (except truncated type No. 5575) shown on previous page. Held flush with outer edge of housing by spring steel clips. No. 5586 coloured lens can be used with this louver.

When ordering No. 5586 coloured lens, specify whether red, amber, green or blue colour is required.

LUMILINE BRACKETS

No. R-3160, R-3162

No. LB-1200, LB-1800

No. 3172

No. K-4700

No. 6005

No. LB-1800-2

No. LB-1200, LB-1800

A very shallow fixture, only $\frac{7}{8}$ " deep, suitable for surface mounting. Used extensively on either side of mirrors, and in restaurants and hallways, where the effect of height is desired. Bevelled sides and ends. Finished in polished chrome. Suitable for mounting over No. 1104 switch box. Where an octagon outlet box is used, a special plate to cover the box will be supplied, on request, at no extra charge. No. LB-1800-2, accommodating two lamps, is similar to No. LB-1800 except for width.

No. 3172

A surface mounting bracket with curved ends, recommended for use on either side of round mirrors or other modern curving type of architecture. Finished in polished chrome.

No. K-4700

A quality design with its narrow length and recessed round back-plate ($4\frac{1}{4}$ " diameter) for covering $3\frac{1}{4}$ " or 4" outlet box. Finished in polished chrome.

No. 6005

Consists of a plain metal box for use under kitchen cupboards, in coves, or any other concealed areas. Supplied with $\frac{1}{2}$ " knockouts in back and ends. Finished in baked white enamel.

No. R-3160, R-3162

Reflector type bracket for surface mounting over bathroom mirrors. Suitable for directing light to special displays, bulletin boards, etc. Finished in polished chrome.

DAZOR "FLOATING" LAMPS

Bracket Model

Desk Model

Clamped to
horizontal
surfaceScrewed to
slanting
surfaceScrewed to
vertical
surface

Universal Model

Float your light exactly where you want it . . . as quickly and easily as you move your arm. The Dazor Floating Lamp stays put without further adjustment or locking. Raise, lower, push or pull it; swing it through an arc; twist or turn it at an angle—wherever you stop the reflector it "stays put" until you change the position. The Dazor floating principle is entirely different from that of any other lamp, providing true finger-tip control for maximum convenience. It is the answer to efficient localized lighting—either fluorescent or incandescent.

Floating Arm

A strong spring force, acting through a shifting fulcrum and parallelogram on both sections of the double-arm, equalizes the varying forces exerted by the arm, thereby balancing the arm in any position. This is a patented feature found only in Dazor Floating Lamps. The spring mechanism is entirely enclosed within a housing near the base. A choice of four bases, suitable for virtually any application on walls, drawing boards, desks or floors is available.

Universal Model

With this combination base the lamp may be clamped or screwed to any surface—horizontal, sloping or vertical. The base is provided with three holes for mounting with screws; when thus screwed in place, the stud, clamping lug and wing nut are not used. A base pad, to prevent the scarring of fine surfaces, and wood screws for mounting are furnished with each unit.

Pedestal Model

A heavy iron base, 12" in diameter, gives stability to this portable floor-type Dazor lamp. Pedestal measures 39" from floor to arm-hinge at top of pedestal. This model is especially adapted to offices, doctors' quarters and homes.

Desk Model

The weighted base of this Dazor Lamp does not require fastening down, permitting it to be placed anywhere on a flat-top desk, table or other horizontal surface; can be moved as desired.

Bracket Model

A goose neck iron bracket forms the base of this Dazor model. Fastened to underside of drawing board by screws, it leaves upper edge of board clear for T-square, instruments or rolled cover.

NOTE: After mounting lamp, the standard that supports the arm should be adjusted to a vertical position; otherwise arm tends to rotate to low point of arc.

Finish

The standard Dazor finish is statuary bronze baked enamel. Inner surfaces of reflectors are white baked enamel.

CSA Approval

All Dazor lamps are approved by the Canadian Standards Association, but must not be used in locations where they may be subjected to oil.

DAZOR "FLOATING" LAMPS

Fluorescent Pedestal Model

FLUORESCENT PEDESTAL MODEL

Using Two 15 Watt Fluorescent Lamps

The Fluorescent Pedestal Model is an all-purpose floor lamp, especially suitable for shops, physicians' offices, studios and homes. It is handy in the sick-room for nurses' use, or as a patient's night lamp. Reflector is 18 $\frac{3}{4}$ inches long. Ballast is installed in the base.

Equipped with 2-conductor No. 18 POSJ midrip brown cord, extending 8'9" from the base, and a No. 7701 rubber cap.

FLUORESCENT UNIVERSAL MODEL

Using Two 15 Watt Fluorescent Lamps

The Fluorescent Universal Model fastens to practically all types of factory or machine shop equipment: lathes, drills, presses, shapers, milling machines, assembly benches, inspection tables. To repair benches in jewellery, engraving, radio, typewriter and bicycle shops . . . to tables or walls in dental, medical and chemical laboratories . . . to drawing boards . . . to business machines, desks, tables and files in offices . . . to desks and work benches in private homes and basements. The 24" arm extension is recommended for average-size benches, machines, desks and stands; the 34" for drawing boards, executive desks and large working

Fluorescent Universal Model

areas. Reflector is 18 $\frac{3}{4}$ inches long. Ballast is installed in housing beneath the spring mechanism.

Equipped with 2-conductor No. 18 POSJ midrip brown cord extending 8'9" from the base, and a No. 7701 rubber cap.

FLUORESCENT BRACKET MODEL (Not Illustrated)

Using Two 15 Watt Fluorescent Lamps

The Fluorescent Bracket Model provides convenient, easily directed light for architects, draftsmen and artists. The goose-neck base attaches with screws to under side of drawing board, leaving top of board entirely free of obstruction. T-square may be used along upper edge and board cover may be rolled into hollow of the goose-neck fitting. This base is also adaptable to certain benches and machines. Reflector is 18 $\frac{3}{4}$ inches long. Ballast is installed in housing beneath the spring mechanism.

Equipped with 2-conductor No. 18 POSJ midrip brown cord, extending 8'9" from the base, and a No. 7701 rubber cap.

DAZOR "FLOATING" LAMPS

Fluorescent Desk Model

Incandescent Desk Model

FLUORESCENT DESK MODEL Using Two 15 Watt Fluorescent Lamps

The Fluorescent Desk Model is portable, requiring no screws or clamps; base is weighted to support the floating arm in any position while resting on any level desk, table or stand. Convenient for flat-top desks of executives, architects, accountants, clerks. For slanting surfaces, such as drawing boards, specify the Universal or Bracket Model. Reflector is 18 $\frac{3}{4}$ inches long. Ballast is installed in the base.

Equipped with 2-conductor No. 18 POSJ midrip brown cord, extending 8' 9" from the base, and a No. 7701 rubber cap.

INCANDESCENT MODELS Using One 40 or 60 Watt Lamp

These lamps have the same broad applications as outlined for the corresponding fluorescent models. They are serving assemblers, inspectors, mechanics and repairmen. They are popular with architects, engineers, draftsmen, artists, chemists, amateur and professional photographers. They have many

uses in offices in connection with adding machines, mimeograph machines, and similar equipment, and in homes. The 24" arm extension is recommended for average-size benches, machines, desks and stands; the 34" for drawing boards, executive desks and large working areas.

Equipped with 2-conductor No. 18 POSJ midrip brown cord, extending 8' 9" from the base for the 24" arm, and 7' 10" for the 34" arm; and a No. 7701 rubber cap.

KONDU BRACKETS AND LANTERNS

No. 5374

No. 5380

Fabricated from cast sections, this equipment combines sturdy construction and utility, with an appreciation of authentic detail and artistic charm.

ORDERING INSTRUCTIONS

To ensure accurate filling of your order please supply the following information in addition to the catalogue number.

Finish

Brackets and lanterns can be supplied in black, green, swedish iron or bronze finish. If color is not stated black will be supplied.

Material

Made of cast iron. Bronze and aluminum can be supplied as special, prices on application.

List Prices

Prices shown apply to either $3\frac{1}{4}$ ", 4", 5" or 6" holders. State size required.

Glass

Clear pebbled, clear sanded, amber pebbled and amber sanded. Amber opalescent may be supplied if desired, at a slight additional cost. Please state color when ordering. Globes not supplied.

Length Overall

For lantern brackets, is the distance from top of spear to bottom of spear, knob or stem, and in globe brackets, from end of knob or spear to top of globe holders.

Lantern Size

This size is from top of roof to bottom of lantern frame or flange.

Socket Base

Brackets are supplied with $\frac{3}{8}$ " or $\frac{1}{8}$ " standard nipples. If desired $\frac{1}{2}$ " nipples can be supplied.

Wiring

All brackets and lanterns are wired and supplied with sockets. C.S.A. approved.

THE GOTHIC LANTERN LINE

No. 2520—2521

No. 2518

No. 2516—2517

No. 2519
Weatherproof Outside Wall Lantern

These lanterns are designed to harmonize with formal Gothic architecture. Panels are of amber glass, and metal parts are finished in bronze. No. 2516 and 2517 are equipped with a downlight re-

flector, and louver to prevent direct viewing of the light source. Four 60 watt lamps on a separate circuit provide suitable illumination of the side panels.

NEON AND ARGON GLOW LAMPS

NEON GLOW LAMPS

Neon Glow Lamps are low voltage lamps of the gaseous discharge type. They are ideal as indicators for appliances, wiring devices and industrial apparatus because they require little power, can operate on standby battery or generator service, and stand up under shock and vibration.

These lamps glow with a distinctive orange-red color, making the use of colored cover glass unnecessary. They have a dependable long life of approximately 5000 hours, and operate very reliably — when normal life is ended, they do not suddenly fail. Practically no heat is given off, since current consumption is very low.

Neon glow lamps are made in a variety of sizes and wattages to meet every need. They are normally usable on A.C. or D.C. circuits. On Direct Current only one electrode (negative) glows, producing approximately the same light output as the combined electrodes on Alternating Current.

Bayonet Base Lamps (except NE-53)

These lamps are supplied without series resistor in base. External means must be provided to limit current to normal amount. External resistors, to be supplied by user, should be of the values marked "EX" in column "Series Resistance," for operation at rated voltage.

Screw Base Lamps (and NE-53)

Required series resistor for operation at the rated voltage is mounted within base. See values marked "IN" in column "Series Resistance." Lamps may be operated at higher circuit voltages by use

of suitable external resistors supplied by user — see below.

Operation of Neon Glow Lamps on Higher Voltages

Since Glow Lamps operate at low values of current it is practicable to apply them to higher voltage circuits using external resistors to absorb the added voltage. The table below gives the recommended values for four voltage ranges. The resistors must be suitable for the voltage applied and have capacity to dissipate several times the nominal lamp watts.

ARGON GLOW LAMPS

Description

These glow lamps contain an argon gas mixture and produce light as a glow covering the electrodes. The color is a pale blue-violet and the light output is small. They find use as light sources principally in companion use with neon glow lamps as a second color to the neon red.

These lamps are also sources of near ultraviolet radiation. Their small size, low operating temperature and simplicity of operation are desirable characteristics. The near ultraviolet energy is of the nature which causes many materials to fluoresce and is highly actinic, making the lamps useful in some photo processes.

While the visible light is in relatively narrow lines the ultraviolet is in broad bands that provide almost continuous energy from the limit of the visible to

the region where the glass envelope no longer transmits.

No danger of ultraviolet burns of the eyes or skin is involved in the use of these lamps as the dangerous short radiation is not present and, of course, the total energy is low.

Life

Like the neon glow lamps these argon-filled lamps have a low rate of depreciation. The argon lamps are shorter lived and approximate values for average useful life for the $2\frac{1}{2}$ -watt lamps are 2000 hours and for the $\frac{1}{4}$ -watt lamps are 1000 hours. These are in terms of use of the visible light output. The useful life as ultraviolet sources is less—average useful life (to 50% of initial output) for the $2\frac{1}{2}$ -watt lamps is 750 hours and for the $\frac{1}{4}$ -watt lamps is 150 hours.

*Bulbs are designated by a letter to indicate shape and a figure to indicate the approximate diameter in eighths of an inch.

†Applies to a new lamp.

‡The 1 1/16" dimension is for glass parts only; the lamp has wire terminals which extend 1 1/16".

ΔCentre electrode connected to base shell.

□NE-34 and NE-40 are supplied with red sprayed finish at additional charge of 8 cents each.

§D.C. starting voltage is for lamp connected so that centre electrode is negative.

†Upper electrode connected to base shell.

‡Average useful life of NE-2 is in excess of 25,000 hours when operated with 200,000 ohms series resistance on 105-125 volts.

▲May be operated on 135-volt D.C. circuits.

LOXON LOCKING LAMP GUARDS

Breakage and theft take a heavy toll from users of large numbers of lamps. To stop breakage a sturdy guard is necessary. To stop theft an effective lock is required. The Loxon line does this double duty at a very small original cost. These dual-purpose lamp guards are made for all types of sockets. They are quickly and easily attached to the socket and locked with a key, one of which is furnished with each dozen guards. All guards are made of steel, heavily tinned.

*Takes 50-watt rough service A-19 lamp.

SAFETY VAPOUR-PROOF PORTABLE GUARD

This strong, portable, sealed lamp guard is water-tight, dust-tight and moisture-proof. The plastic handle and fibre cage are shock-proof and non-sparking. A rubber gasket placed between the cage and handle absorbs all stress and strain, preventing breakage. The heavy glass protecting globe eliminates possibility of breakage of the lamp bulb inside from splashing liquids. Being air-tight these guards are perfectly safe for use where vapour and dust infused air is prevalent. They have no equal for safety, service and convenience around flour mills, paint booths, finishing rooms, airports, warehouses, food processing plants, shipyards, aboard ships, and many other places.

The No. 3007 has plastic cage. No. 3006 has a heavily tinned, electrically welded wire cage. Equipped with No. 4003 keyless socket.

BUNGHOLE SAFE-T-LAMP

The Bung-hole Safe-T-Lamp is a vapour-proof lighting unit for inspecting gasoline, oil, chemical and other drums used for explosives. Made of non-sparking metal throughout. Furnished with a 15-watt, 120-volt T7 intermediate base clear lamp. Overall length 30". Outside diameter 1½". Cord not supplied.

APPLETON PORTABLE REELITES

PORTABLE TYPES

An automatic reeling device for extension light cords. The light is always available within arm's reach and no time is lost in untangling cords or plugging in for new extensions. Each reel has a ratchet stop which works exactly like a window shade. Cover plate fits $3\frac{1}{4}$ " or 4" outlet boxes. Finish is light grey enamel. Supplied with No. 16 gauge, 2-conductor cord.

MACHINE TOOL TYPE

This Reelite is equipped with a connector body so that any portable electrical tool or device can be attached.

Finished in light grey enamel, with base for attaching to $3\frac{1}{4}$ " or 4" outlet box. Supplied with 25 feet of No. 16 gauge, 2-conductor cord.

WALL BRACKET

This bracket is recommended for wall mounting of Portable Reelites. May be ordered separately or with Reelite, at an addition of \$2.50 to price of Reelite.

†Lifting capacity. For devices attached to cord of Reelite listed above.

APPLETON RETRACT-O-REEL

The Retract-o-Reel is a light weight all cast aluminum balancing reel used for supporting portable tools, air and electrical devices weighing up to 10 lbs. Reels support light weight drills, screw drivers, assembly tools, etc., directly over production line while operator is otherwise engaged.

The Appleton Retract-o-Reel embodies the following features:

1. The newly designed wire grip stopper employs a wedge type principle of gripping, which insures extra long life for the wire rope, while assuring a positive grip — no set screws to injure or break the wire rope even with constant operation.
2. The end of the wire rope is furnished with an eye loop made of a swaged-in thimble, permitting quick tool connection.
3. The Retract-o-Reel turns on self-lubricated oil-less bearings.
4. Furnished with 6 feet, preformed wire rope, rubber bumper, cable clamp, and thimble in swaged eye loop.

RETRACT-O-REEL HAND WHEEL

Hand wheel fits tension adjustment stud on Retract-o-Reel. It affords safe and quick spring

tension adjustment for proper balance especially after reel servicing.

WIRE CONNECTORS; MCGILL LAMP CHANGERS

MARR INSULATED CONNECTORS

Suitable for both fixture and wiring work. Wires are rigidly held in brass insert by set screw. Bakelite insulating cap screws on quickly and easily. No. 1 has capacity of from two No. 18 to three No. 14 and one No. 18 wires. No. 2 has capacity of up to five No. 12 solid wires.

No. 5 has porcelain insulating cap in place of the bakelite cap. It is for use only where excessive heat is present. No. 550 is supplied with bakelite cap, and is approved for 600 volt circuits.

MCGILL LAMP CHANGERS

McGill Adaptable Lamp Changers are supplied with a coil spring around the ends of the finger tips. This coil spring grips the lamp firmly and makes it much easier to remove.

This changer has the added safety feature of insulation. A 1 3/4" insert of insulating material prevents any possible shock or injury should the lamp changer come into contact with live wires.

Steel poles are available. They come in 5-foot sections, and should be ordered according to the length of pole desired. For example, "one 15-foot pole." Poles longer than 30 feet are not recommended. Prices of changer heads do not include poles.

THOMPSON LAMP LOWERING HANGERS

Cut-away view of Model L-241 disconnected and partially lowered

Thompson Hangers in all types of installations, indoors and out, bring the fixture down to the man instead of sending the man up to the fixture. This is logical and results in absolute safety. There is no electrical hazard as the fixtures are disconnected when lowered, and there are no ladder or climbing hazards, no scaffolds, platforms or slings required.

The Thompson Hanger is essentially a latching type, overhead disconnecting switch and a fixture lowering and raising device combined. It consists of two members, upper and lower.

The upper member, carrying a pair of upper contact assemblies to which the current feed wires attach, is firmly secured to the supporting structure. The lower member carries the engaging lower contact assemblies, wired to the lighting fixture which it supports.

The entire operation of unlatching and disconnecting, lowering and raising, positioning, reconnecting and latching, is a simple manual one by means of the regulated pull and release on the small chain or cable used to lower and raise the fixture.

Electrical Characteristics

Thompson Hangers are divided into two definite

types from the standpoint of the Electrical Characteristics.

1. The two-pole hanger in various models for heavy service, both indoors and out, where single circuits of two wires only are required. These hangers are Underwriters' rated and approved for 15 amperes at 600 volts, 30 amperes at 250 volts A.C., and 20 amperes at 250 volts D.C.

2. The 3-Way 4-Wire hanger with four poles, in various models for indoor use only, are Underwriters' rated and approved for 15 amperes at 115 volts, 7½ amperes at 230 volts A.C., on each circuit. They can be used for any combination, such as two circuits 3-wire leaving one pole blank, two circuits each 2-wire, or three circuits 4-wire.

Both types are designed for multiple and parallel circuits commonly found. They are not recommended for high tension series use, as there is no provision for shunting across the line when the hanger is disconnected in lowering. The two-pole hangers, are, however, used in series work within their capacity range, when separate manual shunts or IL transformers are provided.

They may be used anywhere that open fixtures are permitted BUT SHOULD NOT be used in hazardous locations where vapor- or explosion-proof fixtures are required.

The two-pole hangers are suitable for single or group clusters of incandescent or fluorescent fixtures with 2-wire primary circuits, or single mercury fixtures, when wired to the 2-wire secondary circuit.

The 3-Way 4-Wire hangers are particularly suitable for combination mercury-incandescent fixtures, double or triple mercury fixtures, or double or triple fixtures where individual control is desired for regulating lighting intensity or color combinations.

Construction

All hangers in the 100 series have solid, one-piece canopies only. Hangers in the 200 series have two-piece, removable, medium depth canopies. This arrangement facilitates wiring and permits ease of inspection and cleaning. These hangers are recommended for very dirty locations indoors.

Two-pole hangers (100 and 200 series) are supplied with canopy drilled for ¾" conduit entrance. For open wiring, a removably inserted, 2-hole, threaded porcelain bushing secured by a ¾" locknut is provided. Four-pole hangers (300 series) have canopy drilled for ¾" conduit, locknut connection.

All load-carrying parts, except the manganese bronze latchdog, are malleable iron or steel, cadmium plated or galvanized. Everdur or Olympia bronze sheave axle screws, nuts and washers. Lock beam

THOMPSON LAMP LOWERING HANGERS

No. L-141

No. L-183

No. L-245

stem is of interrupted rib design for accurate positioning and greater rigidity.

Finishes

Standard finish, baked black japan on sheave housing, canopy and spring housing.

Cadmium-plated or Hot-dip Galvanized finishes are also available and will be furnished when so specified. These special finishes also include silver-plated contacts, cadmium-plated latchdog and cotters. To order, designate by adding to the hanger catalogue number, suffix letter SA for cadmium or SB for hot-dip galvanized finish, and add \$4.00 to the price. Other special colors or finishes quoted on request.

If chain is to be used, specify size in order that hanger stems may be reamed to correct size. Mention of the fixture make and type to be used with the hangers assists in checking chain size and type of adapter to be supplied.

Every installation of Thompson Hangers requires the use of some accessories, such as pulleys, chain or cable, lock boxes or grip cleats, etc. Such equipment must be ordered separately. Complete information on request.

2. All Thompson Hangers in the 100 and 200 series are supplied with standard fixture connecting adapter type F with $\frac{1}{2}$ " male pipe thread, unless otherwise specified.

All Thompson Hangers in the 300 series are supplied with standard fixture connecting adapter type M with $\frac{3}{4}$ " male pipe thread unless otherwise specified.

The following adapters, all interchangeable, will be substituted on specification with no change in price per hanger. Add to the hanger catalogue number, the letter shown before the adapter type desired.

G $\frac{1}{2}$ — $\frac{1}{2}$ " female pipe thread (for 2-wire hangers only).

G $\frac{3}{4}$ — $\frac{3}{4}$ " female pipe thread (for 2-wire hangers only).

H —Swing suspension eye only.

J —Swing suspension eye and S-hook.

K —Crowfoot with $\frac{5}{8}$ " cap screw and lock washer.

HH—Double hook for double bail suspended fluorescent or cold cathode fixtures.

M — $\frac{3}{4}$ " male pipe thread (for 4-wire hangers only).

N — $\frac{3}{4}$ " female pipe thread (for 4-wire hangers only).

(Continued on next page)

*Also 2 circuit, 3-wire or 3 circuit, 4-wire.

NOTES

1. When ordering, be sure to specify whether hangers are to be chain or cable operated in order that correct swivel dead-end fittings will be fur-

THOMPSON LAMP LOWERING HANGERS

(Continued from previous page)

3. Radial Adjustment Adapter, Type R, can be supplied with all Thompson Hangers for use with bail or yoke suspended, angle type reflectors and floodlights. Add the letter R as a suffix to the hanger catalogue number, and \$6.00 to the price per hanger.

4. Hangers in the 100 and 200 series can be supplied with spring housing provided with bakelite conductor cable clamps, for carrying the weight of conductor cable. Particularly desirable when adapters types H, J, K, HH and R are used with the hangers. The standard spring housing of the 300 series hangers is provided with two drilled and tapped bosses to receive two pairs of conductor cable clamps. To order, add 1000 to the standard catalogue number and \$2.00 to the price.

5. All Hangers, except Catalogue Nos. L-137, L-177 and L-1177, can be furnished with the duplex arrangement of upper member — that is, the sheave housing separated from the canopy and with flange plates attached to each, for connecting with a $\frac{3}{4}$ " conduit stem of length to suit the installation. Conduit stem is not furnished.

This arrangement eliminates the necessity for long drop stems below the hanger and also makes possible turning the sheave housing to any desired radial angle to the canopy and its wiring entrance.

To order, add 2000 to the standard catalogue number, bringing the number to the L-2100 series for one-piece canopy hangers, L-2200 series for two-piece canopy hangers, and L-2300 for the 3-way 4-wire hangers. Add to the price per hanger, \$3.00 for black japan finish, or \$3.40 for plated finish to match hanger.

PULLEYS

Thompson pulleys are designed primarily for use with Thompson Hangers and for interchangeable use with various types of suspension accessories. They are closely shrouded and the wheel groove is

deep so they may be used safely with chain, with cable from $\frac{1}{4}$ " Tiller to as small as $\frac{3}{32}$ " diameter, or with rope $\frac{1}{2}$ " diameter or smaller. Housings and wheels are malleable iron, wheels cadmium plated. Axle rivets are Everdur or Olympia Bronze.

For this assembly add 2000 to pulley number, and increase price \$1.80.

THOMPSON LAMP LOWERING HANGERS BEAM CLAMPS

Thompson Beam Clamps permit suspension of Hangers and many devices from structural steel members, without drilling. They may be used with the various flange plates direct when attached to horizontal members.

The gravity suspension fittings are used separately or with the beam clamps to permit vertical suspensions from sloping or arched surfaces of structural members. Parts are malleable iron, cadmium plated or hot-dip galvanized.

FLOODLIGHTING FOR RECREATION CENTERS

General Electric floodlights cover a complete line, which are designed to give the proper type and size of floodlight for any ordinary application. High efficiency is assured from scientific design and thorough testing. Long life and low maintenance expense is obtained through sturdy construction.

A modern recreation center where the whole family can enjoy itself has many advantages. Forward-looking recreation directors are finding

that well planned centers are ideal for planning and programming many outdoor sports under a single management.

Adequate floodlighting, by extending outdoor activities into late evening, increases the usefulness of a recreation center. It adds hours to the day. Floodlighting is the one best way to serve people who have time for recreation only after normal working hours.

Typical Recreation Center

The recreation center that you want may be quite different from the one shown here. Yours will need to be designed to your available space and local interests; it needs the vision and enthusiasm of local people to plan and carry it through.

ADVANTAGES

1. A self-contained center aids effective organization of recreation.
2. It is easier to manage than dispersed game areas.
3. By centralizing the recreation area, important savings in supervision and maintenance costs are made.
4. Strategic location encourages large scale use.
5. A good recreation center commands universal interest and wide use.
6. Its size and nature naturally adapt it to inclusion in broad plans for civic improvement.
7. Sponsorship, and possibly endowment, can frequently be found for this highly practical type of "living" memorial to war heroes or prominent citizens.
8. A well planned center permits the most economical use of space.
9. Idle, or low-value land can usually be used.
10. A co-ordinated center can be built faster than equivalent scattered game areas — important wherever people lack adequate outdoor play space.

FLOODLIGHTING OPPORTUNITIES

SPORTS

Baseball Fields

The survival of minor-league professional baseball through the last ten years is said to be due largely to night games — played under floodlights. It is generally agreed that night baseball is here to stay because of the greatly increased attendance and gate receipts that are obtained.

Football Fields

The popular interest in night games and the added gate receipts have been the salvation of football in many high schools and small colleges. General Electric can furnish inexpensive floodlights and practical recommendations for this type of lighting.

Softball Fields

This tremendously popular game is gaining rapidly, an important contributing factor being the greatly increased attendance and the increased possible use of fields through floodlighting. There are cases on record where softball in towns having a population of only a few hundreds regularly draws night-game attendance of 2000 to 3000 spectators. Wherever softball is growing in popularity, General Electric floodlighting will help it grow profitably.

Tennis Courts, Park and Playground

The value of recreational facilities is increased through floodlighting because more people can use them. The cost of floodlighting is, in most cases, only a small fraction of the cost of providing additional facilities. One tennis court, for example, illuminated until 11 p.m. can handle up to twice as many evening players as one which must close at twilight. General Electric floodlights are easy to install in an attractive manner.

Gun Clubs, Driving Ranges, Swimming Pools

Recreational facilities like these, operated by clubs or by small commercial enterprises, are most attractive to the users and more profitable to the operators when equipped with floodlighting. Floodlighting makes these facilities usable at more convenient hours for most people and makes it possible for more people to become interested.

Other Sports

Recommendations are readily available for such other sports as: Archery, Badminton, Basketball, Bowling Greens, Boxing Ring, Curling Rinks, Golf Driving Range, Handball, Hockey Rink, Horseshoe Pitching, Lacrosse, Race Tracks—Horse and Auto (Half Mile), Skating Rink, Skeet Shooting, Ski Jump, Ski Slope, Soccer, Volley Ball.

FLOODLIGHTING OPPORTUNITIES

BUILDINGS AND AREAS

Office Buildings, Banks, Stores, Theatres

Dignified, conspicuous advertising that draws favorable public attention is obtainable with floodlighting. It points out to great numbers of people, most of whom are at work during the day, the place of business of the better type of concern that takes pride in its building and its community.

Monuments and Public Buildings

Statues, public buildings and places of historical interest, in which the community takes pride can be given greater prominence with floodlighting — in fact, a prominence that is even greater at night than by day. In most cases, only a few General Electric floodlights are needed to obtain this result.

Gasoline Filling Stations, Roadside Stands, Parking Lots and Tourist Camps

These highly competitive businesses that cater to the public on the move find that their profits depend upon attractiveness of appearance which must be recognizable at a glance. Floodlighting meets the night-time requirements economically and is practically a necessity where competition is keen. A few General Electric floodlights and pump-island luminaires will help any such business.

Railroad Yards, Docks, Bridges, Aqueducts, Reservoirs and Mines

In addition to enhancing speed and safety in handling equipment and material, floodlighting is a worthwhile protective measure against mischief-makers and thieves. In most cases, the number of floodlights required is relatively small, but they must be efficient, suitable for the service, and properly applied. General Electric floodlighting will meet these requirements.

Protective Lighting and Construction Work

Night work is easier, is less costly in delays and losses, is safer under floodlighting. General Electric floodlights have many advantages over makeshift equipment—they are efficient, give proper distribution of light, are light in weight but durable, and are inexpensive.

Other Applications

Wherever light can save time or make working conditions safer; wherever it can increase business by attracting favorable attention; wherever it can protect property—wherever any or all of these conditions exist out of doors, there is likely to be a practical use for floodlights.

HOW TO PLAN ATTRACTIVE ECONOMICAL FLOODLIGHTING

Floodlights are used for so many and such different purposes that it is practically out of the question to reduce floodlight application to a matter of reading a few simple tables. The average floodlighting project presents an individual illumination design problem which, for its solution, calls for some explanation of how to get good results from floodlights.

Large projects which require many kilowatts of lighting deserve careful consideration by engineers with considerable experience. Projects that involve unusual lighting effects or special installation or operating conditions likewise call for specialized experience. From our nearest office, you can obtain carefully planned recommendations for any project.

However, the average installation involving relatively few floodlights can be designed easily, simply by following the general principles and using the simplified method described below. Both principles and method are those used by experienced engineers in the solution of such problems and can be depended upon to give practical results.

For floodlighting of outdoor sports, we recommend that prepared lighting plans which we will furnish upon request be followed as closely as possible. These convey, for most sports, the recommendations of the National Electrical Manufacturers' Association and represent the experience of the engineering staffs of the member companies.

FOR ATTRACTIVE LIGHTING

Plan Substantially Uniform Illumination

The illumination that satisfies the eye as to level and degree of uniformity is the most effective, most satisfying type for most projects.

Choose Floodlight Locations For Balanced Illumination

When floodlighting a flat surface, the selection of

floodlight locations that provide for the projection of light beams at right angles to the surface gives best efficiency and maximum reflection of light in a useful direction. However, projection at an angle is often times desirable to avoid "flatness." Where beams are to be projected at an angle, either to avoid "flatness" or because of limited choice of floodlight locations, two or more floodlight locations should be sought to prevent harsh shadows.

Cover the Surface Efficiently

Select beam spread and lamp size to give satisfactory coverage with the smallest number of floodlights. If there is any doubt, work out several possible solutions and select the most economical.

When beams from several floodlights are used to cover an area, locate and aim the floodlights so that the beams overlap by at least one-third of their spread. The greater the overlap, the smoother the effect will be and the less serious a lamp outage will be.

Aim Beam Centers Toward Points that Need Emphasis

Use the maximum candlepower of the beam center to build up illumination on the portions of the area that are hardest to light or that need to stand out from the rest. To illustrate: the building on a filling station plot usually deserves principal emphasis, for the sake of advertising value received; therefore it is advisable to aim the beams generally toward the building.

Avoid Objectionable Glare

Glare interferes with seeing, destroys attractive appearance, and may make the installation uneconomical or introduce hazards. Therefore, avoid aiming light beams directly into people's eyes. If it is necessary to project beams against normal lines of sight, use mounting height of at

HOW TO PLAN FLOODLIGHTING

least 20 ft. (and preferably 25 ft.) and aim floodlights so that spill light will not be objectionable on adjacent property or street. (Important note: In all sports floodlighting, follow the manufacturer's recommendations for mounting height and aiming.)

Visualize Completed Installation

Conditions surrounding particular projects are seldom ideal; and there is seldom only one right solution to a floodlighting problem. Therefore, it is important to try to visualize a completed installation, to decide if it will satisfy the desire for utility, eye satisfaction, and economy.

FOR GOOD APPEARANCE AND EASE OF MAINTENANCE

Make Floodlights Inconspicuous

Features of the building or grounds that permit concealment and make the floodlights relatively inaccessible to the public should be utilized. In general, the aim should be to get the best efficiency and coverage with minimum glare and, at the same time, to locate the floodlights out of reach of those who would tamper with them or damage them accidentally or maliciously. The use of steel poles designed especially for floodlighting is suggested because:

1. They may be placed at the most favorable locations for good floodlighting.
2. They are slender and thus relatively inconspicuous.
3. They are easily painted to harmonize with surroundings.
4. They are strong and durable.
5. They are relatively inexpensive.

Keep in Mind the Problems of Relamping and Cleaning

Use a method of mounting that will support the weight of a man on a ladder; or, provide a lowering hanger or a hinged pole. Securely clamp the floodlights after adjusting, and mark the settings so that the floodlights can be re-aimed if accidentally moved.

FOR EFFICIENT OPERATION

Use Lamps of Correct Voltage Rating

The cost of lighting is generally lowest when lamps are operated at their rated voltage. The only common exception to this rule exists in sports

floodlighting where, with only 300 hours or less of operation per year, the best economy results from operating lamps at about 10 per cent over rated voltage. In case of doubt as to what voltage rating to call for, consult the local central-station company.

Provide Adequate Wiring

Excessive voltage drop in wiring reduces light output immensely without appreciably reducing watts input. Wire sizes should be calculated for not more than 2 per cent voltage drop from distribution panel to lamp socket with full load burning.

FOR LONG LIFE AND LOW MAINTENANCE COST

Check Service Conditions

The floodlights listed on the pages which follow are suitable for the average outdoor operating conditions. The following special conditions may call for special equipment.

1. Adverse atmospheric conditions.
Excessive moisture or water vapour.
Corrosive or explosive gases.
Excessive dirt, dust, and soot.
2. Bad temperature conditions.
Excessively high ambient temperature.
Sudden large changes in temperature.
Too large lamps.
3. Severe vibration, such as encountered on heavy machinery.
4. Rough handling or flying debris.
5. High circuit voltage, in excess of 250 volts a-c.

Where such conditions are encountered, ask for our recommendations for your specific problem.

Specify Enclosed Floodlights

A cover glass or lens offers these advantages:

1. Better long-time efficiency of operation, by reducing the accumulation of dirt and dust on lamp and reflector surfaces.
2. Saving through easier maintenance — cleaning is easier and is required less frequently.
3. Saving through protection of lamp bulbs from cold, rain, and sleet.

HOW TO PLAN FLOODLIGHTING

A SIMPLE METHOD FOR SOLVING PROBLEMS

Recommended for simple projects requiring relatively few floodlights and involving no special illumination or installation problems; applicable only to the general-utility types of floodlights. Important note: For sports lighting, refer to lighting plans which we will furnish on request. Let our illumination engineers and lighting specialists help you with your large or special projects.

Steps

1. Select watts-per-sq-ft value.
Refer to accompanying tables.
For applications not listed, use wattage value of some comparable listed application.
2. Multiply by area to determine total wattage.
3. Select floodlight location.
4. Divide total wattage by number of locations, to determine wattage at each location.
Note that wattage need not be apportioned equally if some part of the area should have greater emphasis.
5. Determine beam spreads required for coverage.
6. Select type, size, and number of floodlights to give this coverage and operate this wattage.
Use nearest listed beam spread and standard lamp wattage.
7. Select beam aiming directions.
Portions of the area that are hardest to illuminate from the locations selected, or that require special emphasis.
8. Prescribe any additional lighting recommended.
Pump island lights? Sign lights? Decorative or ornamental entrance lights?
9. Prescribe minimum wire sizes.

Calculate on basis of 2 per cent voltage drop from distribution panel to load; increase size thus calculated, if necessary, to comply with C.S.A. Code for description of permissible branch circuits.

A—Buildings on white ways; intensive street lighting; streets with many conflicting signs and light sources; lower portions of buildings falling under Class B locations.

B—Medium-intensity white ways; secondary business streets with few conflicting signs, etc.

C—Very little conflicting light, such as on residential streets, parks, lighted highways, etc.

G-E GENERAL PURPOSE FLOODLIGHT

TYPE L-49 — 300/500 WATTS
TYPE L-43 750/1000 WATTS

REPOSITIONING STOP

No. 5552519P

The repositioning stop fits over the degree scale to facilitate resetting, if the floodlight is rotated for servicing. Die-cast aluminum. Adjustable for any position.

This vertical repositioning stop furnished as standard equipment with these floodlights.

Also adaptable for horizontal repositioning on oval base and pipe-clamp mountings, add \$1.25 to price.

*500-watt G-E general-service lamp; PS-40 clear bulb; 7-in. light-centre length; 9850 lumens.

†1000-watt Mazda general-service lamp; PS-52 clear bulb; 9 1/4-in. light-centre length; 21,000 lumens.

Data are approximate, for estimating.

Factor "F" times distance from projector to surface lighted, gives approximate diameter of beam pattern. For smaller lamps, reduce lumen and candlepower values approximately in proportion to lamp wattage. When door glass is omitted, lumens and candlepower values will be increased initially by 5 to 10 per cent.

G-E AREA FLOODLIGHT

TYPE L-68 — 750/1500 WATTS

The popular floodlight for ground areas — notably sports fields and construction projects — where high candlepower beams will help reach across the area, or where the maintenance savings of an enclosed unit are desired. Highly efficient, durable, light weight, inexpensive.

10 STAR FEATURES THAT CUT INSTALLATION AND MAINTENANCE COSTS

1. Full 180-degree horizontal movement avoids special drilling of cross arms.

2. Hold-down and clamping bolts at different levels permit full swing of wrench.
3. Clamping bolt in handy position on right-hand side.
4. Projector swings into position for easy access.
5. Single large easy-working catch secures door.
6. Handgrip makes door easy to handle.
7. Vertical repositioning stop assures return to original position.
8. Slide door hangs out of the way when open.
9. Pressure-type clamp tightens without moving projector.
10. Mounting bracket lets rain water drain away, reducing decay and corrosion.

CANADIAN
GENERAL ELECTRIC

G-E SPORTS FLOODLIGHT

TYPE L-69 — 1500 WATTS

A new floodlight for sports fields and recreation areas which will reduce installation and maintenance costs. Every worthwhile feature, from the results of long engineering experience, is incorporated in this floodlight — spun-in glass front — impact-resisting tempered plate glass — rifle sights and both horizontal and vertical degree scales — outstanding high beam efficiency — choice of three beam spreads.

New Narrow Beam L-69

For such applications as stadiums where floodlights are mounted more than 150 feet from the side lines, and railroad yards where long narrow areas are involved.

Provides superior utilization of light — equal if not greater than that usually obtained with heavy-duty more expensive floodlights. The L-69 narrow beam floodlight, where applicable, will produce better results with the general service lamp than the heavy-duty type using a floodlight lamp.

In addition, the L-69 offers higher initial output, lower cost, and easier maintenance.

Cat. No.	Price Each	Description	Weight (Lbs.)	
			Ship.	Net
COMPLETE FLOODLIGHTS				
A54G7	\$63 00	Medium beam polished	29	18½
A54G17	59 00	Wide beam etched	29	18½
A54G8	63 00	Narrow beam polished	29	18½
ACCESSORIES AND PARTS				
78X332	\$ 1 75	Socket		
8475970G2	59 00	Reflector Medium beam polished Alzak fin. aluminum		
8475970G4	50 00	Wide beam etched Alzak fin. aluminum		
8475970G5	59 00	Narrow beam polished Alzak fin. aluminum		

NOTE: Prices on reflectors include front glass, collar, and latches. Lamp not included; use 1500-watt general-service lamp, PS-52 clear bulb, 9¾-in. light-centre length.

G-E SPORTS FLOODLIGHT

TYPE L-69 — 1500 WATTS

It's easy to put the center of the L-69's beam right on an aiming point with the notch (1) and blade (2) rifle sight. Saves time in tuning up installation for best light coverage of field. Note how workman uses handy built-on wrench to release clamping bolt.

Handy "built-on" clamping-bolt wrench saves time and effort in adjusting the light or in tilting the reflector for servicing. No tools to carry (to drop). The convenient one-side clamping securely locks the light in position. Severe vibration won't move it.

Servicing is as simple as A, B, C! First, release the two quick-acting toggle latches which secure the socket housing to the reflector collar.

Now—and without any need whatever for moving the reflector—lift off the socket housing and the lamp. It weighs only four pounds!

Next slip this heavy stainless steel clip over the trunnion bracket as shown in the next illustration . . .

And now with both hands free you're ready to service the light. Arrow shows auxiliary reflector, rigidly mounted.

See how easily you can clean the reflector, without tilting it.

Tilting the reflector is easy if it ever becomes necessary. No tools required and reflector always returns to its original position.

G-E AREA FLOODLIGHT

TYPE L-45 AND L-46 — 300/1500 WATTS

PORCELAIN ENAMEL OPEN TYPES

Type L-45

Type L-46

Inexpensive, durable, open floodlights with porcelain-enamelled reflector, for close-range illumination of filling stations, work, storage, parking, and sports areas, playgrounds, etc. Auxiliary Alzak finished aluminum reflectors provide increased illumination of areas or buildings that require special emphasis.

Features of L-45 and L-46

1. Watertight cable snubbing gland.
2. Cast aluminum socket housing, aluminum-paint finish.
3. 4-foot cable (2-conductor No. 12) for convenient wiring.
4. Sturdy, malleable-iron cross arm mounting provides full 180-degree rotation. Degree scale. Galvanized.
5. Heavy steel trunnion bracket strongly bolted to base. Galvanized.
6. Degree scale aids initial setting and servicing. Adjustable repositioning stop available at slight additional charge.
7. Heavy-duty, porcelain-shell mogul socket keeps lamp in fixed focus. Includes lamp grip.
8. Convenient one-side clamping.
9. Asbestos-treated gasket makes joint watertight.
10. Highly efficient, long-life, porcelain-enamelled, steel reflector, double-coated green outside, triple-coated white inside.
11. Steel ring distributes pressure of attachment screws; prevents chipping enamel.

G-E HEAVY DUTY FLOODLIGHT

TYPE L-38 — 200/250 WATTS

Type L-38-B floodlight for general service lamp

Type L-38-B portable for general service lamp

A sturdy cast aluminum casing makes this compact and inexpensive floodlight popular for rough-service applications — such as on power shovels. However, a variety of beam spreads and mountings adapt it to all common floodlighting uses. Also available with large base, carrying handle and 10-foot cord for portable emergency applications.

FEATURES

1. Heavy-duty medium screw-base socket rigidly mounted to keep lamp in fixed focus.
2. Extra strong door clamps assure tight joint.
3. Sturdy cast aluminum casing and door.
4. Clamping bolts easily accessible; maintain aiming directions securely.
5. 4-foot cable (2-conductor No. 12) for convenient wiring.
6. Heavy-steel trunnion bracket permits aiming in any direction; galvanized.
7. Door and glass sealed with waterproofed asbestos gaskets.
8. High efficiency, long life reflector silvered-glass or Alzak finished aluminum.
9. Heat and weather-resisting molded door glass.
10. Combination clamping and hinge bolt supports door when opened.
11. Large malleable-iron base for surface mounting; galvanized.

G-E HEAVY DUTY COPPER-BRONZE FLOODLIGHTS

TYPE L-30 — 300/500 WATTS

TYPE L-31 — 750/1000 WATTS

This high-quality all-purpose projector features a highly efficient silvered-glass or aluminum narrow-beam reflector in a sturdy, attractive copper casing which assures long life under severe atmospheric conditions. Several useful beam spreads are obtained with different door glasses.

SILVERED-GLASS REFLECTORS

For maximum efficiency, G-E engineers recommend silvered-glass reflectors.

Since these reflectors have the G-E porcelain-enamel backing, there is no danger of deterioration resulting from high temperature and moisture. This method of manufacture seals the silver surface between two layers of glass, thus preventing any possibility of oxidation or separation.

Accelerated tests, as well as service experience, have proved the durability of this silvering. Therefore, with the mechanical protection afforded by these sturdy floodlight casings, the use of glass reflectors is practical under all conditions,

except those involving extremely rough usage. In such instances, the aluminum reflectors listed with this floodlight are recommended.

G-E HANDY FLOODLIGHTS

TYPE L-65 — 100 WATTS

TYPE L-66 — 200 WATTS

Handy floodlights with wide angle beams, etched surface aluminum reflector, for general-purpose lighting around homes, garages, farm buildings, etc., offering convenience, protection and aid to work or business at night. Inexpensive, durable and compact.

FEATURES OF L-65 AND L-66

1. Highly efficient aluminum reflector with etched (diffuse) inner surface. Natural finish outside.
2. Rigidly mounted medium screw-base socket maintains lamp in fixed focus.
3. 6-foot rubber-covered cord and plug.
4. Molded clear door glass protects lamp and keeps reflector cleaner.
5. U-shaped clamping band and gasket insure tight door seal.
6. Easy adjustment horizontally and vertically with large wing nuts.

DIMENSIONS

G-E PUMP ISLAND LUMINAIRE

FORM 92 — 300/500 WATTS

Highly efficient Alzak -finished aluminum reflector provides wide spread of light without objectional glare.

Three bronze thumb screws with wing lock nuts clamp reflector securely to globe.

Strong crystal-clear rippled glass globe makes a secondary light source of attractive appearance.

Internal steel ring holds globe securely against cushion.

Snug fitting reflector lip provides an effective rain shield.

Cork gasket cemented to reflector protects globe edge against damage, keeps out dirt and insects.

Heavy-duty porcelain mogul-base socket rigidly mounted to position lamp properly in relation to reflector.

Sturdy cast-iron base, hot-dipped galvanized, slips over 2-in. pipe, held firmly by setscrews.

An attractive enclosed-type luminaire for lighting gasoline-pump islands and surrounding areas. Fits 2-in. pipe. Easily installed, offering even distribution of light without objectional glare. Highly efficient, easily maintained, and inexpensive.

G-E DRY-NICHE UNDERWATER FLOODLIGHT

TYPE L-39 — 500/1000 WATTS

Type L-39 underwater floodlight with reflector in position for servicing

This high quality dry-niche underwater floodlight is principally used in swimming pools. It offers high efficiency, a variety of beam angles, easy maintenance, and long life. Cast bronze construction is specially recommended for best results and should be used to prevent deterioration in chemically treated water. Strong, durable, easy to install. Reflector silvered glass.

FIVE FEATURES ASSURING LONG LIFE AND LOW MAINTENANCE

1. Sturdy, heat-resisting, molded door glass.
2. Large rubber gaskets assure watertight seal.
3. Double-ring construction protects glass by uniform distribution of pressure.

4. Clamping screws seat on lower ring, to avoid additional pressure on door glass.
5. Highly efficient silvered-glass reflector, correctly positioned for best results.

G-E ELECTRIC FOUNTAIN EQUIPMENT

Installations of G-E Typical Electric Fountain Settings Showing Day and Night Views

In enhancing charm and increasing utilization of any park, garden, or estate, in providing a dignified but striking commercial display, as a handsome personal or civic memorial — the modern electric fountain is without equal in the floodlighting field.

Standardized groups of specialized components are furnished by G-E so as to simplify construction while allowing much freedom for individual fountain design.

Electric fountains produced by G-E are thoroughly modern in design and a definite asset to any park, public or private. Installations are such that color and water effects are continually changing, yet all operation is automatic and requires only

initial push-button actuation. Although each fountain listed below, when properly installed, is capable of providing spectacular display as a unit, several may be combined to produce more elaborate decorative effects. For best results, the smaller fountains should be located where there is little or no extraneous lighting.

Much care should be given to basin design and setting of the electric fountain in anticipation of daylight operation of water effects. Execution in concrete, tile, fieldstone, precast artificial granite in various colors, glass brick, and many other materials provides limitless variation and individuality at the discretion of the consulting architect-engineers.

CANADIAN
GENERAL ELECTRIC

UNION METAL STEEL POLES FOR SPORTS LIGHTING

Designed especially for sports floodlighting; now including many improvements that aid installation and servicing. Ideal for high quality installations because of simple, clean appearance, high load capacity, long life. Mounting heights in accordance with NEMA recommended practice.

MONOTUBE POLE FEATURES

1. Poles can be completely wired, lights mounted, and positioned on the ground before erection.
2. Servicing of lights easily and safely accomplished.
3. Taper reduces wind loads, provides great strength and minimizes obstruction to spectator view if poles are placed in front of grand stand.
4. Adequate strength where it is most needed without excess weight.
5. Anchor base construction simplifies erection, permits positive alignment, avoids ground line deterioration and provides almost 100 per cent salvage if poles must be moved to new location.
6. Poles require no guying.
7. Add to the general attractiveness of your sports field layout.

Poles are equipped with reinforced handhole and cover, wire outlets, and supports for mounting service platform, transformer and distribution boxes. Safety-service platform equipped with mesh flooring

UNION METAL STEEL POLES FOR SPORTS LIGHTING

welded in place and a hinged trap door in centre. Platform with mounting frames are assembled ready to be bolted to pole.

Capacity of pole to carry the maximum number of lights indicated in the head arrangement selected, is based on using underground wiring, with floodlights not exceeding 20 in. diameter and wind loading up to 100 miles per hour. Special consideration must be given for floodlights of larger diameter or if overhead wiring is used.

40- and 60-foot poles are shipped in one piece. 80- and 100-foot poles are shipped in two sections. Upper and lower sections are carefully shop-fitted before shipment and properly marked for field identification with one coat of rust resisting paint before shipment. Poles are painted inside and out. Template drawings for setting foundation bolts furnished. Foundation bolts shipped in advance of poles if requested.

When ordering, specify the pole height, the number of lights to be mounted and the design number applying to this combination, as shown in the table above.

Design numbers include pole with anchor base and pole top, anchor rods and nuts, pole steps, combination safety-service platform and floodlight mounting frames.

Design numbers do not include floodlights, transformer or distribution boxes. *2-light mounting not equipped with service platform.

†8- and 16-light poles can be equipped with an auxiliary rear frame to permit front and back mounting of floodlights. Specify Cat. No. 1YB2561 and add \$45.00 for each frame to price shown above, shipping weight is 118 lbs. for each frame.

G-E FLUORESCENT LAMP BALLASTS

Experienced architects, purchasing agents, and other experts who prepare specifications for fluorescent-lighting installations always choose ballasts with the utmost care. They realize that ballasts are both the heart and the brain of an efficient lighting installation. Poorly designed ballasts frequently result in early end-blackening of lamps, aggravate the effects of line-voltage variations, and materially shorten lamp life.

These experts know, too, that the electrical characteristics of good ballasts must be carefully co-ordinated with those of the lamps, and that the ballast-manufacturing processes must be rigidly controlled to obtain uniformity of characteristics in all units of the same rating.

The complete line of General Electric ballasts for fluorescent lamps meets these requirements. The design of all ratings conform to the specifications of the lamp manufacturers. Uniformity is maintained by automatic winding of coils, silver-soldering of all connections, machine assembly of core and coils, and by other advanced manufacturing methods. Depending on the design, every G-E ballast receives from 7 to 10 tests during manufacture.

The use of G-E ballasts in fluorescent-lighting installations is extra assurance of high operating efficiency, long lamp life, and a high return on the investment in the form of better lighting.

Canadian General Electric Company are the largest manufacturers of fluorescent ballasts in Canada and are the only suppliers of a complete line of ballasts to meet the entire requirements of fluorescent fixture manufacturers. At present over 130 ratings of hot cathode, cold cathode, instant start, slimline and circline lamp ballasts are available for frequencies of 25, 50 and 60 cycles and direct current operation. A few representative types are shown below.

The ballast for the fluorescent lamp serves to limit the current to the proper operating value. Specifically designed ballasts are required for each lamp rating, frequency, and voltage range. The ballast must be designed to forestall early end-blackening of the lamp — to smooth out the effect of line voltage variations, and assure rated lamp life. Further, the ballast should be quiet in operation, and must itself have long life. It may be said that a fluorescent lighting installation is no better than its ballasts.

G-E MERCURY LAMP BALLASTS

GENERAL ELECTRIC BALLASTS FOR HIGH-INTENSITY MERCURY VAPOR LAMPS

High-intensity mercury-vapor lamps are modern and highly efficient lighting tools for a wide variety of applications. The successful operation of these lamps depends on a ballast that must give proper starting and running characteristics, and must be a dependable source of power. As a result of close coordination of ballast design and lamp design, General Electric has developed lines of ballasts that assure matched performance with the lamps and most efficient operation.

Ballast Construction

These ballasts are accurately designed with permanent characteristics which will insure successful lamp operation. They are carefully fabricated from highest-quality materials and have ample exposed core surfaces (except weatherproof units) to dissipate the heat with resulting low internal temperatures and consequent long life. The weatherproof ballasts are assembled in a sheet metal housing which is filled with a heat conducting compound.

Mechanically, the ballasts are exceptionally sturdy. A strong internal framework supports the ballast and holds the core and coil and housing firmly together. This clamping structure is strong enough to support the ballast and lamp for pendent installation.

Power Factor

For stable operation high-intensity mercury vapor lamps require ballast, such as a high-reactance transformer. The use of such inductive ballast results in a low line power-factor (50%-65% for the various lamps) unless some method of power-factor improvement is used. The use of the G-E Tulamp ballast or other ballasts having improved power-

factor is recommended. Reduced wiring cost and compliance with regulations concerning power-factor are thus assured.

Tulamp ballasts make use of the split-phase principle in which one lamp is ballasted by inductance and the other lamp primarily by capacitance. The lagging power-factor of the "lag" branch offsets the leading power-factor of the "lead" branch, resulting in an over-all power-factor of above 95%. Furthermore, the phase displacement of currents in the two branches results in a materially reduced stroboscopic effect when the lamps are mounted adjacent to one another in pairs.

High-power-factor in the single-lamp enclosed ballasts is obtained by the use of a G-E Pyranol capacitor which is included in the housing.

Types of Ballasts

Enclosed single-lamp ballasts are listed for the H-1, H-2, H-4 and H-5 lamps. Roomy junction boxes are built into these ballasts. The ballasts can be mounted on the wall or ceiling or suspended from conduit. Thus, they can be installed in a variety of ways easily and quickly.

The enclosed single-lamp ballasts for H-9 lamps are provided with a junction box for direct conduit connection of line and lamp. These units are suitable for wall mounting.

Enclosed Tulamp ballasts are provided for the H-1 and H-5 lamps. As only one ballast is required for two lamps, lower first cost and installation cost result. These are suitable for wall or ceiling mounting. A large junction box is a part of the housing.

Core-and-coil ballasts and weatherproof ballasts

G-E MERCURY LAMP BALLASTS

are available for all except the H-9 lamp. Further information will be supplied on request.

Temperature and Ventilation

To prevent damage to the ballasts for the H-9 high-intensity mercury-vapor lamp, it is vital that

the ballasts be installed so as to permit free circulation of air around them, and they should always be mounted vertically with the wiring compartment at the bottom. Ambient temperature of any ballasts for high-intensity mercury-vapor lamps (H-1 to H-9) inclusive should never exceed 45°C.
